The body is 12½ inches long, the wing 9. The bird is brick-red with black arrow-heads on the back, the under parts being some shade of buff, fawn, or rufous, much spotted with black, and the head, neck, and rump being mostly bluish-gray. It inhabits parts of Asia and Africa, as well as the whole of Europe. It builds in hollow trees and in cliffs, or in nests deserted by crows, magpies, etc., and feeds on mice, small birds, and insects. The kestrel may be recognized by its habit of hovering or sustaining itself in the same place in the air by a rapid motion of the wings, always with its head to the wind (whence the names *damme* and *windhover*). The male and female differ in color, ash-gray prevailing in the former and rusty brown in the latter. This hawk being regarded as of a mean or base kind, *kestrel* was formerly often used as an epithet of contempt. The term is extended to a number of species of the restricted genus *Tinnunculus* or *Cerchneis*. The American representatives are commonly known as *sparrow-hawks*. See *under* *sparrow-hawk*. Also called *damme* and *windhover*.

Kettledrums.

adjusting the tension of the head. In orchestral music two or more kettledrums (technically called *stomms*) are employed, tuned at different pitches, usually at the tonic and the dominant of the piece to be performed. As the pitch may be accurately fixed, kettledrums are much used, in conjunction with other instruments, for emphasizing the rhythm, and for increasing the sonority of the general effect. They are also much used in short solo passages and various experiments have been made, with extended and elaborate effects, with a large number of drums.

The king doth wake to-night, and takes his rouse;
Keeps vassal, and the swaggering up-spring reels;
And, as he drains his draughts of Rhenish down,

The district where they occur lies to the northwest of Lake Winnobago and Green Bay in Wisconsin, where it is locally known as the *potash kettle country*. Those who gave the name had the idea that the cupriferous series was distinct in geological age from the sandstone lying

adjacent to it on the east and west, which is generally admitted to be the equivalent of the Potsdam sandstone of the New York Survey, and of which the so-called Keweenaw appears to be a local modification, originated by intense volcanic action along a line stretching from the extremity of Keweenaw Point in Michigan southwest to beyond the borders of Minnesota.

[Cayphas and Anna of that kept the key.
Joseph of Arimathea (E. E. T. S.), p. 33.

She took the little ivory chest,

Hence—2. Something regarded as analogous to a key, in being a means of opening or making clear what is closed or obscure; especially, that by means of which (often by means of which alone) some difficulty can be overcome, some obstacle removed, some end attained, something unintelligible explained, etc.: as, the *key* to knowledge; Gibraltar is the *key* to the Mediterranean; a *key* to the solution of an algebraic problem; a *key* to an algebra or arithmetic (a book giving the solution of mathematical problems proposed as exercises in such text-books); the *key* to a cipher.

Thou art Peter. . . . And I will give unto thee the keys of the kingdom of heaven.

3. In *mech.*: (a) A hand-tool for controlling a valve, moving a nut, etc., which is independent of the part to be moved. In this sense a spanner, wrench, bedstead-wrench, etc., are *keys*.

(b) Any device for wedging up or locking together different parts, or for jamming or binding them to prevent vibration or slipping. Such are: (1) the wedge or cotter driven between the hub of a wheel and its shaft to bind the two together; (2) a wedge in a chain to prevent slipping; (3) a wedge put in a split tenon to cause it to spread when driven into a mortise. (c) A bolt which secures the cap-square to the cheek of a gun-carriage. See *cut* under *gun-carriage*. (d) In *masonry*, the central stone of an arch or vault, usually the uppermost stone; the keystone (although in a true arch no one of the voussoirs is more important to the stability of the structure than any other). See *cut* under *arch*. (e) In *carp.*: (1) A piece inserted in the back of a board to prevent warping. (2) The last board in a series of floor-boards, tapering in shape, and serving when driven home to hold the others in place. (3) The roughing on the under side of a veneer, designed to assist it in holding the glue. (f) In *bookbinding*, one of a series of small tools used by the sewer of a book to keep the bands in place when the sections of the book are in a sewing-bench. They are made of metal or hard wood, shaped like a yoke, or the letter U, and of the size 1 by 3 inches. (g) A joint to assist in supporting a train of rods and the tools in a tube-well. (h) A wrench or lever for tuning stringed instruments of fixed intonation, like the pianoforte and the harp; a tuning-wrench or tuning-hammer. It consists of a metal head hollowed so as to fit closely over the tuning-pins, and a handle, usually long enough to give considerable leverage. (i) The surplus mortar or plaster that passes between the laths, and serves to hold the plastering in position. (j) A hollow cut in the back of a tile or terra-cotta ornament, or on a wall, to hold mortar or cement.—4. In *musical instruments*: (a) In instruments especially of the wood wind group, a lever and valve operated by the player's finger, and designed either to open or to close a hole or vent in the side of the tube, so as to alter the pitch of the tone by altering the length of the vibrating air-column within. While in the simpler varieties of the flute, the oboe, the clarinet, etc., such holes are controlled by the fingers directly, in more complex varieties the number of holes is so great, and their position and size are so inconvenient, that this supplementary mechanism is a necessity. A complete system of keys was first elaborated for the flute by Theobald Boehm in 1832, and has since been applied to the oboe, the clarinet, and to some extent to the bassoon, with a decided gain in ease of manipulation, length and fullness of compass, and sonority of tone. Partial systems of keys are also found in the English horn, the bassoon, etc. Holes and keys have been used in various brass wind-instruments, notably in the bugle and the saxophone, though as a rule they are less used than valves. (See *valve*.) See *cuts* under *flute*, *clarinet*, *oboe*, etc. (b) In instruments with a keyboard, like the organ and the pianoforte, one of the levers which are depressed in the act of playing. When operated by the finger, it is more exactly termed a *digital* or (rarely) a *manual*; when operated by the foot, a *pedal*. In the pianoforte each key or digital is connected with a series of levers, by which a hammer may be thrown against the string or strings belonging to that key, at the same time lifting from the strings the damper that prevents their vibration. When the key is released, the damper falls and stops the vibration. The duration, the force, and to some extent the quality of the tone depend upon the way in which the finger depresses the key. (See *touch*.) In the harpsichord each key, with its levers, slips a leather or quill plectrum past the string, so as to snap or twang it. In the clavichord each key presses a metal tangent against the string, so as to drive it into vibration. In chimes of bells rung from a keyboard, each key throws a hammer against one of the bells. In the pipe-organ each key, whether a digital or a pedal, is connected with a series of levers, by which a valve is opened to admit the compressed air from the bellows into a particular groove or channel, over which stand all the pipes belonging to that key. The number of pipes actually sounded depends upon the number of stops drawn. (See *cut* under *organ*.) In the harmonium and reed-organ each key, with its levers, opens a valve, by which either an outward or an inward current of air is set up through the groove or channel with which each key is connected, so as to snap or twang it. The number of reeds sounded depends upon the number of stops drawn. (See *cut* under *reed-organ*.) Keys in this sense are also (unfortunately) called notes. They are arranged according to an arbitrary plan, some being colored white and some black, and they are named by letters, etc., for which see *keyboard*.

She guides the finger o'er the dancing *keys*, . . .
And pours a torrent of sweet notes around.
Cooper, Charity, I. 109.

5. A part pressed by the finger to control the action of a typewriter or other similar machine, in the manner of a musical keyed instrument.

—6. Any one of the various forms of circuit-closer used in electrical experiments and in the practical applications of electricity. See *tele-graph*.—7. In *music*: (a) In *musical theory*, the sum of relations, melodic and harmonic, which exist between the tones of an ideal scale, major or minor, and in which its unity and individ-

nality are contained; tonality. Thus, a proper sense of these relations is called a proper sense of key, and a due observance of them puts a performance in key. For the difference between major and minor keys in this sense, see *mode*. (b) In *musical theory and notation*, the tonality centering in a given tone, or the several tones taken collectively, of a given scale, major or minor. The given tone, or the first tone of the given scale, is called the *key-note*, *key-tone*, or *tonic*; and the key is named by the name of this tone. A scale is simply an arrangement of the tones of a key in their melodic order. In modern music, and in vocal music generally, all major keys are intended to be precisely similar to one another, except in pitch, and all minor keys likewise similar to one another. But in the systems of tuning instruments of fixed intonation before the middle of the eighteenth century, certain keys were favored and others slighted; so that some keys were very useful, and some practically useless. It is said that this difference, which was originally incidental to the imperfect plan of the keyboard, and which was to have been obliterated by the introduction of the equal temperament, is to some extent unavoidable, certain keys having a peculiar quality per se; but these differences appear, on close analysis, to be relative or accidental rather than essential. (See *temperament*.) The keyboard of the organ and the pianoforte, however, is so planned as to make a decided mechanical difference between keys or scales based on different digitals. For example, the major key or scale of the digital called C requires the use of only white digitals, or naturals; hence it is called (unfortunately) the *natural key*. Other keys or scales require the use of one or more black digitals, which are called either *sharps* or *flats*; hence they are called the keys of one, two, three, or more sharps or flats, as the case may be. The keys of one or more sharps are called collectively the *sharp keys*; those of one or more flats, the *flat keys*. Practically, keys of more than six sharps or flats are rarely mentioned. (See *circle of keys*, under *circle*.) When these keys are represented by the staff notation, the black digitals are indicated by marks ♯ or ♭ prefixed to certain of the notes. But since the key in which a piece is to be performed is the same either throughout, or at least for extended passages, these sharps or flats are customarily grouped into a *key-signature* at the beginning of the piece or passage, and the effect of this signature is understood to continue until contradicted by further signs: thus—

(The crosses mark the degree belonging to the key-note.) The sharps and the flats in such signatures are counted from left to right; in sharp signatures the position of the key-note is always one degree above the last sharp, while in flat signatures it is always on the same degree with the last flat but one. This provides a rule for finding the key-note from each signature except those of the keys of C and of F. The key-notes of the sharp keys, taken in direct order, are distant from one another either by a fifth upward or a fourth downward, as are the key-notes of the flat keys, taken in inverse order. These signatures are also used for minor keys, the key-notes of such keys being in each case two degrees below the key-notes as given for major keys. The major and minor keys that use the same signature are termed *relatives* of each other. See *relative*. (See *circle of keys*, under *circle*.) The entire system of keys as described above is conditioned upon the keyboard of the organ and the pianoforte, and therefore is essentially arbitrary. It has no basis in the phenomena of sound or the necessities of music as an art. Its complexity is due historically to the inadequate medieval theory of music, and secondarily to the arbitrary instrumental mechanism and the notation that grew out of that theory. Of the many attempts to improve or replace the system, the tonic sol-fa notation has been the most successful. See *tonic*, and *tonic sol-fa* (under *tonic*).

keyboard (kē'bōrd), n. In the organ, pianoforte, and similar instruments, as the harpichord, clavichord, etc., the series or horizontal row of finger-levers or digitals (usually called *keys*), by depressing which the performer causes the pipes, strings, or reeds to produce tones. The visible portions of part of the keys are white, while the others are black. The black keys are the shorter, and are raised above the level of the white keys; they are always separated from one another by one

Keyboard of a Piano, showing two octaves.

or two white keys, so as to form groups alternately of two and three. The depression of which the keys are capable is technically called the "dip." The keyboard contains altogether from fifty to ninety keys, the ratio of white to black being 7:5. The right-hand end of the keyboard is called the *upper*, because the keys there produce high tones, and the left-hand end is correspondingly called the *lower*. The white key next below (to the left of) the upper key of every group of three black keys is called A; the next white key to the right of this is called B; the next is called C; and so on, up to G, next to which another A is found. In Germany, by a curious difference of nomenclature, B is always called H, and B \sharp is called B \flat . (See *B quadratum* and *B rotundum*, under *B*.) In tuning, the tones produced by the various keys called by the same letter-name are made exact octaves of each other. The black keys are named by reference to the white keys on either side of them: thus, the black key between A and B is either A \sharp or B \flat , that between C and D is either C \sharp or D \flat , etc. When a white key is to be specially distinguished from a black one, it is called a *natural*: hence a scale or series of tones produced by using only white keys is called the *natural scale*, and its key (tonality) is called the *natural key*. (See *key*.) In general, a key next on the right to any given key is the *sharp* of the latter, and the second key to the right is its *double sharp*; while a key next on the left to any given key is the *flat* of the latter, and the second key to the left is its *double flat*. Thus, every key on the keyboard, except the black key called either C \sharp or A \flat , has three names: as A = G \sharp = F \sharp , B = A \sharp = G \flat , C = B \sharp = A \flat , etc.; A \sharp = B \flat , C \sharp = D \flat = B \flat , etc. (See *flat* and *sharp*.) The several keys and octaves are usually calculated from middle C—the C nearest the center of the keyboard, and historically the middle tone of the medieval hexachord system (see *hexachord*)—the vibration-number of whose tone is theoretically from 250 to 355. (See *C*.) The keyboard of the organ usually extends four to five octaves, from the second C below middle C to the third A or C above middle C; that of the pianoforte usually extends six to seven or seven and a third octaves, from the third A below middle C to the fourth A or C above middle C. The organ usually has keyboards both for the hands and for the feet, the former being distinguished as *manual keyboards* or *manuales*, the latter as *pedal keyboards* or *pedales*; and there are usually two or more manual keyboards, each with its own sets of pipes or stops, and capable of being used either independently or in conjunction with the others. The principal keyboard is that of the great organ: that above it is that of the small organ; that below it (when there are three), that of the choir organ. (See *organ*.) In the old harpsichords and similar instruments two keyboards were sometimes provided, the one producing tones of different quality or force from the other. The keyboard has been developed gradually. Its first appearance was about the end of the eleventh century, when large levers that could be manipulated only by the whole hand or a blow of the fist, having a dip of several inches or even a foot, were introduced into the organ, and later into the clavichord and

similar instruments. Only the levers corresponding to the modern white keys (*diatones*) were used at first; those corresponding to the modern black keys (*chromas*) were introduced in the twelfth to the fourteenth century, probably in this order: *Bb, F, C, G, D, A*. The chromas were first placed in a distinct row from the diatones; but in the fifteenth century all were combined into a single keyboard. The pedal keyboard was invented for the organ about the same time. Until the close of the eighteenth century the keys were colored white and black in exactly reverse order from the modern custom. (For a description of the mechanical details of the keyboard, see *organ* and *pianoforte*.) The gradual development of the keyboard kept pace with the gradual unfolding of the theory of the musical scale and of tonality. (See *temperament*.) To avoid the inaccuracy of many of the intervals in equal temperament, keyboards with more than twelve digitalis and tones to the octave have been devised, but their use has been principally confined to acoustical investigations. The mechanical manipulation of the keyboard in musical performance involves a thorough muscular discipline of the hands. See *touch*, *fingering*, *technique*. — *Choir, great, pedal, solo, swell* keyboards, in *organ-building*, the keyboards belonging respectively to the choir, great, pedal, solo, and swell organs. kidneert, kidneret, *n.* Middle English forms of *kidney*.

kidney (kid'ni), *n.* [*< ME. kidney, kedney, kidnei, kidenet, a corruption of kidneer, kidnere, kidnere, kideneiro, < *kid, appar. for quith (E. dial. var. kite), the belly, + neer, nere, kidney: see*

kite and *neer*.] 1. In anat., a glandular structure whose function is the purification of the blood by the excretion of urine; one of the renes or reins; a renal organ. Kidneys are of very various shapes and positions in the body, and often of loosely lobulated structure. In the higher vertebrates they are always paired and of compact figure, tending to become bean-shaped glands, as in man. The kidneys of man are situated in the loins, opposite the upper lumbar vertebrae, behind the peritoneum, embedded in fat, and capped by the adrenals or suprarenal capsules. The left is somewhat higher than the right, which leaves room for the liver. They are purplish-brown in color, about 4 inches long, $\frac{3}{4}$ broad, and $\frac{1}{2}$ thick; they weigh about 4½ ounces. Section displays an outer cortical substance, darker and softer than the rest, consisting chiefly of uriniferous tubules and Malpighian corpuscles. (See *corpuscle*.) The inner or medullary substance is composed of numerous distinctly striated conical masses, or Malpighian pyramids, whose bases are directed peripherally, while their apices converge toward the interior, ending in the papillae, which project into the cavity of the pelvis. There are from 8 to 18 such pyramids, composed mainly of minute straight and looped uriniferous tubules, which proceed from the cortical substance to open on the papillae. One such papilla, or a set of several papillae, protrudes into a compartment of the general cavity called a *calyx*; the calyces unite in three infundibula, the beginnings of the general cavity of the kidney, the pelvis, which is also the funnel-shaped beginning of the ureter, the tube by which the urine passes to the bladder. The hilum of the kidney is the place on the median or concave side of the kidney, corresponding to the place of the scar on a bean, where the ureter goes out, and where the vessels and nerves enter. The organs are abundantly supplied with nerves, blood-vessels, and lymphatics. In its minute and essential structure the kidney consists of a great number of branching, looped, and convoluted epithelial tubes (*tubuli uriniferi*), terminating in dilatations, each dilatation enveloping a plexus of blood-vessels and forming a Malpighian body. These tubes, moreover, are abundantly supplied with blood-vessels. Malpighian bodies and tubules both share in the work of secreting, but there is reason to think that the former have to do with the secretion of the water and less important parts of the urine, while the elimination of the nitrogenous waste falls on the tubular epithelium. The kidneys, or, in the singular as a collective noun, the kidney, as an important internal organ whose condition is a more or less accurate index of one's bodily health, and, as formerly thought, of one's "humor" or temperament, was formerly often spoken of (somewhat like *liver, heart, bowels, stomach, etc.*) with reference to one's constitution, temperament, temper, disposition, or inward feelings. As thus used in the quotation from Shakespeare, the word has been misunderstood, as if meaning "sort" or "kind," whence that use in later authors.

Section of Human Kidney.

Kilns may be divided into two chief classes: those for direct burning, in which the material is submitted to the action of flame, the fuel

Killdee (*Spizella vociferus*).

and material being mingled together in one furnace; and those for vitrifying, drying, and baking, in which the material is separated from the furnace proper. The lime-kiln represents the first class. It consists of an upright furnace resembling a blast-furnace, the limestone and fuel being fed into the top and the burned lime or quicklime being drawn below. (See *lime*.) To the second class belong the pottery-kilns, brick-kilns, and porcelain-kilns. The pottery- and porcelain-kilns, which include also terra-cotta, drain-pipes, and other similar kilns, consist of a structure, usually of brick, circular in section and cone-shaped, the furnaces being arranged around the edge below, and the hollow space within being filled with the materials to be burned or vitrified. In the common pottery-kiln the materials are exposed directly to the flames from the furnaces. In the kilns for finer ware the materials are protected from direct contact with the fire. Drying-kilns for malt, hops, grain, lumber, etc., are strictly dry-houses or drying-rooms, though sometimes called kilns. Fruit-kilns are now superseded by evaporators. Brick-kilns are properly distinguished from brick-clamps by the fact that the furnace is a permanent structure. See *brick*.

But in future the ultimate standard will be the international kilogram at the Pavillon de Breteuil near Sèvres; this substitution will not alter the value of the kilogram. The kilogram was intended to be (and is, within one ten-thousandth part) the mass of a cubic decimeter of water at its maximum density. It was ascertained by Miller to be equal to 15432.8474 grains, or 2.20462125 Imperial pounds, with a probable error of 3 in the last decimal place. An independent determination by Miller (made merely as a check upon the other) gave 2.20462116, with a probable error of 5 in the last place. The real error, however, and indeed the variations of weight of this ill-constructed Kilogramme des Archives, may very likely be somewhat greater. See *metric system*, under *metric*.

In either use it means that one (or more) who stands in the nearest degree of blood-relationship to the deceased. What degree is deemed nearest jurisdictional; but in general where there are no children, or descendants of children, the father is the next of kin, and if there is no father, the mother, and if no parent, the brothers and sisters are the next of kin, and so on.—**Of kin**, of the same kin; having relationship; of the same nature or kind; akin. It is sometimes preceded by a short vowel, as in *canakin* or *canikin*, *manakin* or *manikin*, *boottin*, etc. In the obsolete *boddikin*, *ladikin* (*ladin*), etc., the diminutive form is due to the tendency to mispronounce. In many words, as *bumpkin*, *duckin*, *friskin*, *grickin*, *kildarkin*, *malikin*, *napkin*, *sickin*, etc., the diminutive force is for various reasons (but chiefly because most of them are not of original English formation) not now perceived. kind² (kind), n. [Cf. ME. *kinde*, *kynde*, *kynd*, *kende*, *kunde*, *cunde*, or (earliest form) *kunde*, < AS. *gecynd*, neut., orig. fem. Kind of (also sort of) runs into certain marked idioms. It is used with a following noun to express something like or resembling or pretty near to what the noun expresses: as, he is a *kind* of fool (that is, not far from being a fool). Then, in careless and vulgar speech, it is transferred (especially in the abbreviated form *kind* o', pronounced *kind* o', and often written *kind*er, where the *r* is never pronounced) to use before an adjective: as, that is *kind* o' good; he acted *kind*er ugly; and even before a verb: as, he *kind* o' (*kind*er) laughed.

Also, in phrases like what *kind* of a thing is this? he is a poor *kind* of fellow (that is, a thing of what kind, a fellow of a poor kind), *kind* of has come to seem like an adjective element before the noun, and hence before a plural noun, after words like *some*, *all*, and especially *these* and *those*.

It sometimes keeps the singular form: as, these *kind* of people. This inaccuracy is very old, and still far from rare, both in speaking and in writing; but good usage condemns it.

kinematics (kin-ē-mat'iks), *n.* [Pl. of *kinematic*: see *-ics*.] 1. That part of the science of mechanics which treats of motion, its direction, velocity, acceleration, composition, etc., without reference to mass or to constraints: opposed to *dynamics*. Thus, the relation between Kepler's laws and the law of gravitation comes under the head of kinematics, because the planet is perfectly free to move and its mass has nothing to do with the question. On the other hand, the consideration of perturbations belongs to dynamics and not to kinematics. Again, the subject of the brachistochrone, though it involves no consideration of mass, is excluded from kinematics, as involving constraint. Statics is not considered to belong to kinematics, since most statical problems involve constraints, though others do not. But the whole distinction between kinematics and dynamics seems artificial, unsatisfactory, and confused.

2. The theory of mechanical contrivances for converting one kind of motion into another, as for example for making a piston-rod with a reciprocating motion communicate to a wheel a uniform rotation. Also called *applied kinematics*.

An instrument for illustrating the results of combinations of arcs of different radii in making curves. Also called *kineoscope*.—3. An apparatus invented by Edison for exhibiting photographic pictures of objects in motion. Its essential parts are a ribbon containing the pictures, a mechanical device for causing the pictures to pass rapidly in succession under a lens or light-piece, a lamp for illuminating the pictures, and a mechanical device for causing a circular revolving screen to move rapidly before them. A slot is cut in this screen, and its revolutions are so timed that the slot passes before each picture just as it is in line with the eyepiece. The effect is to give a view of each picture in succession, and to cut off the view as the picture is moved forward. The apparent result to the eye is a continuous picture in which the objects photographed appear to be in motion.

king-yeard, *n.* [ME. *kyngeyard*, *kyngeyard*, < AS. *cyngeard*, a scepter, < *cyno-*, of a king, + *geard*, rod, yard: see *yard*.] A scepter.

'belonging to a tribe,' or 'descendant of a tribe' (or 'one of noble kin'), < AS. *cynn* (= Goth. *kunt*, etc.), a race, tribe, kin (cf. AS. *cyno-* (= OHG. *chun-*), in comp., of a king, perhaps a contr. form of *cynig* in comp., otherwise a related noun), + *-ing*, a common patronymic suffix: see *kin*¹ and *-ing*². The exact notional relation of *king* with *kin* is undetermined, but the etymological relation is hardly to be doubted. The asserted identity of the word with Skt. *janaka*, a father, is false. There is no connection, as alleged, with *can*¹ and *owning*¹. 1. A chief ruler; a reigning sovereign or monarch; a man who holds by life tenure the chief authority over a country and people. The word is used both as a generic designation of any sovereign ruler and as the specific title of the rulers of certain states distinctively called *kingdoms*. It is applicable by extension to an infant who has become heir to the sovereign power and reigns through a regent. *King*, originally applied to any tribal chief, whether such by hereditary, elective, or military right, took on a more imposing sense with the rise of the modern European states; but it is still used historically, or with a modern intimation or suggestion of royal splendor, with reference to many ancient and modern barbarian or savage tribes, as the ancient Canaanite kings, the Mongol kings of Asia, the ancient kings of Ireland, the kings of central Africa, the American Indian King Powhatan and King Philip, etc. The autocratic or despotic power formerly implied by the title *king* has been almost lost in Europe, where a king is now merely a chief magistrate for life, bound by constitutional and statutory limitations equally with his subjects. The office of king is now, as a rule, hereditary in principle; but in former times it was often elective, or in some manner the subject of choice or selection. In the generic sense, God is often called *King*, as the supreme ruler of the universe. Abbreviated *K.* Who is this *King* of glory? The Lord strong and mighty. Ps. xlv. 6.

There's such divinity doth hedge a *king*
That treason can but peep to what it would.

Shak., Hamlet, IV. 5, 123.

4. pl. [oap.] The eleventh and twelfth books of the Bible. In Hebrew manuscripts they are undivided, and form a continuous narrative of the Hebrew people from the later days of King David to the captivity of Judah in Babylon. The division into two books was first made in the Septuagint and retained in the Vulgate, in both of which they are named the third and fourth books of Kings (the two books of Samuel being the first and second); hence, in the English Bible, the double title "The first book of the Kings, commonly called the third book of the Kings," etc. The period embraces the reigns of all the kings of Israel and Judah, except Saul's and most of David's. The work was probably composed substantially before the end of the captivity. The authorship is uncertain.

The king-crab is so called from its great size; it sometimes attains a length of 2 feet. The carapace is concavo-convex, rounded in front, and movably divided into the larger anterior horseshoe-shaped cephalothorax, whence the name *horseshoe-crab*, and a smaller wedge-shaped abdomen, from which projects a long, sharp, bayonet-like tail or telson. On the upper surface are a pair of large compound eyes, and in front of them a pair of small simple eyes. Underneath are five pairs of long ambulatory legs, springing from the cephalothorax near together, and an anterior pair, much smaller and otherwise modified, and differing in the two sexes. The mouth is in the middle line, behind the first pair of legs. Under the abdomen are a number of movable flaps, in the form of thin plates lying one upon another like the leaves of a book; these are pereopods or swimming-feet, and also respiratory organs or gills. The animal when just hatched is about a quarter of an inch long, has no telson, and the cephalothoracic and abdominal regions are much alike, being somewhat semicircular and hinged by a straight line. The abdomen shows traces of segmentation, and the general aspect recalls that of a trilobite, of which *Limulus* is the nearest relative living. In many respects these strange creatures resemble scorpions, and some contend, therefore, that they are arachnids, not crustaceans. They are found on the eastern coasts of North America and Asia. See *cut* under *horseshoe-crab*.

The term is used with different shades of meaning, but always with this fundamental idea of God's reign as recognized and loyally accepted. Sometimes this reign is spoken of as recognized in the heart and life of the individual, sometimes as supreme in the community, sometimes prophetically as in its perfection embracing the whole body of the redeemed. (See, for a collection of these definitions, Dr. James F. Candlish's "The Kingdom of God," Appendix, note 2, p. 392.)

They nest in holes, and lay white eggs. Their characteristic habit is to sit motionless on the watch for their prey, dart after it, and return to their perch. There are about 135 species and 20 genera, found in most parts of the world, but very unevenly distributed. Thus, there are only 2 species peculiar to northern parts of the old world, only 2 species in North America, and only one genus in all America. The Ethiopian region and the Indian region are about equally rich: the Australian (in a broad sense) is the richest, alone possessing half the genera and half the species. The common kingfisher of Europe, *Alcedo ispida*, a small bird of brilliant colors, is supposed to be the halcyon of classic writers. The pied kingfisher, *Ceryle rudis*, also inhabits Europe as well as other countries. The common American kingfisher, *C. alcyon*, is 12½ inches long, 23 in extent of wings, dull-blue above, white below, with a bluish belt on the breast and in the female a chestnut bar behind this; the wing- and tail-feathers are black, spotted and barred with white; the head is crested. It differs, however, from both these genera in having the leaves crowded at the apex of the trunk, and the flowers likewise crowded in a terminal head, and in

(See 1 Cor. xvi. 20, and other passages of Scripture.) *Kissing* as an act of salutation was not unusual in ordinary intercourse in some of the countries where Christianity first prevailed; but among the Christians the *kiss* of peace was ordered at a very early date to be confined to persons of the same sex. Later, the custom of actually giving the *kiss* fell into gradual disuse, though liturgical forms still survive to represent its spiritual meaning of reconciliation to God and man. In the Western Church the *kissing* of a tablet called the *pax* has, since the thirteenth century, replaced the *kiss* between persons; and this form of the ceremony is still sometimes used at high mass in the Roman Catholic Church, but is not extended to the congregation. Sometimes called simply the *peace*. See *pax*.

knee-joint (nē'jōint), n. 1. (a) The joint at the knee; the joint between the thigh and the lower leg; the articulation of the femur with either or both of the bones of the leg, the tibia and fibula. In man the knee-joint is formed by the articulation of the large external and internal condyles of the femur with the

brund flattened top of the tibia (the fibula being excluded), covered in front by the kneecap or patella, a large sesamoid bone in the tendon of the extensor muscle. It is a ginglymus or hinge-joint, permitting complete flexion,

Human Knee-joint.

1. limiting extension to a right line, and admitting in some positions of slight rotatory movement. As far as the bones are concerned, the knee-joint is one of the most open and insecure articulations in the body; but it is very strongly secured by its ligaments and tendons. These are, on the surface of the joint, a general capsular investment, particularly thick and strong behind, where it is known as the posterior ligament of Winslow, a structure preventing extension beyond a right line; the patellar ligament, that in which the kneecap is situated, and which is the extensor tendon of the muscles in front of the thigh, inserted into the tibia; the internal lateral ligament, partly covering the tendon of the semi-membranosus muscle; and two external lateral ligaments, passing to the head of the fibula. Inside the joint are a pair of cruciate ligaments, crossed like the letter X, passing from the femoral intercondylar notch to the head of the tibia. The nearly flat head of the tibia supports a pair, inner and outer, of semilunar interarticular fibrocartilages. These serve to deepen the depressions which receive the very convex condyles of the femur. These cartilages are interconnected by an anterior transverse ligament, and united to the inner surface of the capsular ligament by two coronary ligaments. The most extensive synovial membrane of the body is found in the knee-joint. Its processes, known as *alar* and *muscular ligaments*, are not ligaments in a proper sense. There are several separate synovial bursae about the joint; it contains a quantity of fat beneath the patellar ligament, and is supplied by appropriate arteries, veins, nerves, and lymphatics. (b) Some joint likened to or mistaken for a knee: as, (1) the carpal articulation of the fore leg of various animals, as the horse; (2) the tarsal articulation of a bird's foot; the heel.—2. Specifically—3. In Europe during the middle ages, a person of noble birth trained to arms and chivalry, first as page and afterward as squire to the sovereign, or to some earl, baron, or other superior lord, to whom he attached himself, and whom he was bound to follow to war on horseback. Knights were of two grades: *knight bachelors* (or simple *knight*), received into the

order with much ceremony and solemnity, in which the church had a large share; and *knight bannerets*, who were generally created on the field by their superior on account of some valorous action, and were entitled to display a square banner, and to hold higher commands, while the former could use only the pennon. In England, under the feudal system, a prerequisite was the ownership of a certain amount of land (called a *knight's fee*), held of the king or of an earl or baron on a tenure which bound the holder to definite military service and other obligations. Although this form of tenure continued until the time of Charles II., the military service was early commuted for a money payment, and the holder of a knight's fee was no longer necessarily a knight. During the age of chivalry following the crusades, knights were bound by the highest obligations to chivalrous conduct, and were supposed to espouse the cause of the unfortunate, especially of women. See *order of knighthood*, under *knighthood*.

A *knight* ther was, and that a worthy man,
That from the tyme that he first bigan
To ryden out, he lovde chivalrye.

4. In Great Britain in modern times, a man upon whom a certain honorary dignity has been conferred by a sovereign as a reward of personal merit of some kind, without reference to birth or possessions, and in no way involving military service, which disappeared as a feature of knighthood with the other institutions of chivalry. In the British empire knighthood confers no privilege other than the social one of precedence next after baronets. Knights have the right to the title *Sir* prefixed to the Christian name, as *Sir William Wallace*; but neither the dignity nor the title is transmissible to heirs, as in the case of baronets (who as such are not knights, although they also have the title *Sir*). The wife of a knight has the legal designation of *Dame*, for which *Lady* is customarily substituted. Knights may still, as in medieval times, hold their rank either simply as individuals or as members of an order. (See *order of knighthood*, under *knighthood*.) Those of the latter class are now created only by royal letters patent; those of the former (knights bachelors) may be so created, but are often personally dubbed by the sovereign with the accolade. This ceremony of the accolade was formerly essential to the creation of all knights, whether by sovereign or feudal superior, and was commonly attended by elaborate observances.

And Helmsley, once proud Bunkingham's delight,
Slides to a squire or a city *knight*.

Pope, Imit. of Horace, II. II. 178.

5. A champion; a warrior; especially, a champion devoted to the service of another; a defender.

6. One of the pieces in the game of chess, having usually the figure of a horse's head. Its move is a peculiar one—from the square it occupies to the opposite corner of any rectangle of two squares by three; and in so moving its course is not obstructed by any intervening or surrounding pieces. The number of squares it commands varies from eight when at least two squares separate it from any side of the board to two when it stands in a corner.

Such machines employ barbed or hooked needles, having some form of latching device for catching the thread and drawing it through a loop previously made in the same thread, and throwing it off at the right moment. It is the use of these needles and of a single thread that distinguishes a knitting-machine from a loom, a braider, or a netting-machine. Hand-knitters by machinery for domestic use employ either series of needles laid flat in a frame or a ring of upright needles placed in the periphery of a cylinder. By the use of various attachments these machines can make hollow or flat knitted fabrics, plain, ribbed, etc. The power-machines are essentially the same as the hand-machines, except that, being larger, they knit wider fabrics. Such slates are called *knotted slates* or *shales* (in German *knottenschiefer*). The *knots* are sometimes simply segregations of ferruginous material around a small fragment of the slate; sometimes more or less distinctly formed crystals, andalusite being the most common mineral thus occurring. This peculiar formation is well shown in the eastern Vosges and in the lake district of England. (g) In *min.*, same as *knole*. (h) In *arch.*, same as *knob*. When the 22-second glass is used, the length of the knot is 47.3 feet. See *log*. (2) A nautical mile. The length of a sea-mile varies with the latitude, according to some authorities; but the United States Hydrographic Office and United States Coast Survey have adopted 6,080.27 feet as its constant length, the English Admiralty 6,080 feet. See *mile*.

In order to remove all uncertainty and to introduce uniformity, this office adopted, several years ago, the value which results from considering the nautical mile as equal to the one sixtieth part of the length of a degree on the great circle of a sphere whose surface is equal to the surface of the earth. This value, computed on (Clarke's) spheroid, is: One nautical mile = 1853.248 metres = 6080.27 feet, a value which corresponds to the adopted length of the Admiralty Knot = 6080 feet.

Report U. S. Coast and Geod. Survey, 1881, p. 354.

(u) In *geom.*, a universal curve in three-dimensional space, which, upon being brought into a plane by any process of distortion whatever without the crossing of one part through another (that is, without passing through a nodal form), will always have nodes or crossings. A knot differs from a link in being uniserial, while a linking consists of two curves or ovals in space, which, after being brought into a plane by the above process, are always crossed the one with the other; a *link* consists of three which are similarly joined together, independently of any linking of pairs of them. An *amphicheiral knot* is one which is its own perversal—that is, whose image in a mirror does not differ from the knot itself in respect to right- or left-handedness. (v) In *Knex*, England, eighty rounds of the reel of balse, wool, or yarn. (p) In *her.*, a piece or two or

1. The state of being or of having become
aware of fact or truth; intellectual recognition of
or acquaintance with fact or truth; the con-
dition of knowing. Subjectively considered, know-
ledge implies clear conviction or a consciousness of cer-
tainty; but this consciousness does not constitute know-
ledge, and may be associated with error.

Knowledge is the perception of the agreement or dis-
agreement of two ideas.

Locke, Human Understanding, IV. I. 2.

The essentials of Cognition, or *Knowledge*, may be
summed up thus:—First. To know any single thing, we
must be conscious of it as Differing from some things, and
as Agreeing with other things. To this extent *knowledge*
involves only what belongs to Sensation and Perception.
Secondly. When *Knowledge* amounts to Affirmation there
are usually at least two things taken notice of: and not
only so, but the couple must be farther viewed, as coming
under a third property, namely one of the Universal Pre-
dicates of Propositions—for example, Co-existence or Suc-
cession. "The sun is a luminous body," "night follows
day"—are higher combinations than the mere *knowledge*
of "sun," "night," "day"; they unite simple or elementary
cognitions into affirmations or propositions; and the bind-
ing circumstance is one of the comprehensive generalities
called Co-existence and Succession. Thirdly. Into these
Affirmations there must enter the active state or disposi-
tion termed Belief (or Disbelief).

Locke, Human Understanding, IV. I. 2.

We have but faith; we cannot know;
For *knowledge* is of things we see;
And yet we trust it comes from thee,
A beam in darkness: let it grow.

Tennyson, In Memoriam, Int.

ferent from . . . the *knowledge* of that phenomenon simply

called philosophical, or scientific, or rational *knowledge*.

kraket, v. A Middle English form of *crack*.

kraken (krā' or krā'ken), n. [Also sometimes *kraken*; < Dan. *kraken*, < Norw. *krake*, a fabled sea-monster: little used in Norw., but appar. a particular use of *krake*, a pole, stake, post, a stunted crooked tree, a hook, also a stunted animal or person, = *Icel. kraki*, a pale, stake, post, = Dan. *krage*, a climbing-pole, = Sw. *krake*, a stunted horse; prob. ult. akin to *E. crook*.] A mythical sea-monster said to appear at times off the coast of Norway. The popular notion of the kraken dates back at least to the time of Pontoppidan (1698-1764), who wrote a description of it. One of the giant squids, as a cephalopod of the genus *Architeuthis*, might furnish a reasonable basis for the myth.

To believe all that has been said of the Sea-Serpent or the Kraken would be credulity; to reject the possibility of their existence would be presumption.

Kyrie eleison (ki'ri-e e-lâ'i-sion). [*Gr. Κύριε ἑλεῖσον*, Lord, have mercy: *Κύριε*, Lord; *ἑλεῖσον*, aor. impv. of *έλεειν*, have mercy or pity; see *Christe eleison*.] 1. Literally, Lord, have mercy! a brief petition, founded on nearly identical Scriptural phrases (for example, Ps. cxxiii. 3, Mat. xx. 30), used as a response in the primitive liturgies and in the eucharistic and other offices of Oriental churches to the present day. In the Latin Church *Kyrie eleison* (thrice) is followed by *Christe eleison* (thrice), and this again by *Kyrie eleison* (thrice). The formula is always said in this Greek wording, but the intermediate *Christe eleison* is unknown to the Eastern Church. The Oriental *Kyrie* is used in the Irenica at the beginning of the liturgy and in other litanies. The Western *Kyrie* (a remnant of the Irenica) is used by the Roman Church at mass just after the introit, and also in the breviary offices and in litanies. In the Sarum missal it also occurred near the beginning of the service, and this use of it is represented in the communion office of the Book of Common Prayer by the responses after the commandments, "Lord, have mercy upon us, and incline our hearts to keep this law." In the same book it occurs in the form "Lord, . . . Christ, . . . Lord, have mercy upon us," in the litany, and before the collect for the day at morning and evening prayer. This is also called the *lesser Kyrie*.

2. The first movement or division in a musical setting of a Roman Catholic mass or the Anglican communion office, the text being the petitions above mentioned.

1. The twelfth letter and ninth consonant of the English alphabet. It had a similar place in the Latin, Greek, and Phœnician alphabets, from which the character has come to us. The scheme of its forms in those alphabets, with the Egyptian characters from which they are perhaps ultimately derived (see *A*), is as follows:

23 26 6

Egyptian, Hieroglyphic, Hieratic.

Phœnician.

Early Greek and Latin.

The *L*-sound is made with the tongue in the same general position against the roof of the mouth as *d* and *t* and *n* (see these letters), and hence is called, like them, a dental (or gingival, or lingual, or tongue-point) sound. Its characteristic peculiarity of utterance is that it involves a breach of the close *d*-position at the side or sides of the tongue, the intonated breath escaping there, while the tip of the tongue remains in contact. This breach may be made on either side of the tongue, or on both sides at once: the habits of different individuals, and perhaps of different communities, varying in this regard. Other *L*-sounds, agreeing with ours in the lateral breach of mute contact, but differing in the position of the tongue, are found in some other languages: as, the palatal *l* of French and Italian (the French *l mouillé*, now mostly converted into a simple *y*-sound; the Italian *gli*), the lingual or cerebral *l* of Sanskrit, and so on. *L* is the most sonorous and continuous, or most vowel-like, of our consonant-sounds; and hence it has come, by the loss of an accompanying vowel, to have itself the value of a vowel in a very large number of English unaccented syllables—especially after a mute, as in *lark, wriggle, bottle, noddle, apple, bubble*; less often after consonants of other classes, as in *muscle, muzzle, raffia, devil*, and colloquially in such as *kernel, gunnel, pommel*. The sign *l* never has any other than its own proper sound; but it is silent in a few words, as *balm, half, salt*. In the recent history of our language the sound is a peculiarly stable one, hardly exhibiting transition into any other; more anciently, and in other tongues, it exchanges sometimes with *d* (as Latin *lacrima*, Greek *δακρυ*), but especially with *r* (thus, in Sanskrit, the *l* is to a large extent a later alternative to an *r*); in many French words it appears converted into *u* (as *mouze*, plural of *mal*, *deux boeides bel, belle*, and so on); in Italian, after mutes, into *o*, as *piano*, Latin *planus*, etc. In virtue of its general phonetic character, *l* is a semi-vowel (so far as that term is admitted), and is often classed as such, along with *r*, or with *r* and *y* and *w*. More popularly, it is ranked as a "liquid," with *m* and *n* and *r*, nothing more being implied in the classification (a loose and unscientific one) than its special sonorousness and continuableness.

2. A symbol—(a) in *chem.*, for *lithium*; also *La*; (b) in Roman numerals, for 50, and with a line drawn above it (*L*) for 50,000.—3. Among their tenets were denial of the obligation of sabbath observance, on the ground that life is a perpetual sabbath; belief in the direct influence of the Holy Spirit; and belief in marriage as a holy ordinance valid only among believers, the children of the regenerate being born without original sin. The sect disappeared about the middle of the eighteenth century.

It is used as a bearing, but especially as a difference, as in cadency, to indicate the oldest son. Some authorities say that the label when used for cadency should have seven points while the great-grandfather of the bearer is alive, five while his grandfather is alive, and three while the father lives. In nearly all

owns the label, whether a bearing or a difference, has an odd number of points. These points are also called *lambeaux*. In a very few cases the label is borne bendwise. A label of three (or more) points crossed has, instead of the ordinary lambeaux, small crosses pointing downward, which may be Latin crosses reversed or Greek crosses. A label of three (or more) pomagranates pendant has, instead of lambeaux, rounded fruit represented as burst open. A label of three (or more) tape pendent has, instead of lambeaux, strips intended to represent the parchment ribbons to which seals are affixed in ancient documents. A label with the points erect, or a label reversed, is seldom used by itself, but in connection with an ordinary label, in which case the blazon is a label counterpoised with another, the points erect, or two labels indorsed, or more rarely bars-gemal patté. See *lambeau*. Also called *file* and *lambeu*.

II. n. 1. A letter or character representing an articulate sound which in speaking is accompanied by a proximate or complete closure of the lips. The labials in English are the mutes *p*, *b*, the nasal *m*, and the fricative *f*, *v* (usually made between lips and teeth, and hence called more exactly *labiodental*); and the semivowel *w* and vowels *oo* (*o*) and *ou*, as involving a rounding of the lips, are often ranked in the same class. 2. In *herpet.*, one of a series of plates or scales which lie along the edge of the lips, especially in *Ophidia*, those of the upper lip being the superior labials, those of the lower lip the inferior labials.—3. In entom., one of the labial palpi.

In his later system the *Labiales* are embraced chiefly in his *Echiales*.

labiate (lā-bi-ā-tē), n. pl. [*NL.* (A. L. Jussieu, 1789), fem. pl. of *labiatus*, lipped: see *labiate*.] The mint family, a very important and extensive natural order of dicotyledonous gamopetalous plants, with a labiate corolla, and a four-lobed ovary, changing to four seed-like monospermous fruits. This order contains about 2,600 species, mostly herbs, undershrubs, or shrubs, rarely arborescent, with opposite or whorled leaves, usually square stems, and a thyrsoid or whorled inflorescence. They are spread throughout the world, being most strongly represented in the Mediterranean and eastern regions, but abounding in all temperate latitudes. Many of the species are valued for their fragrance, as lavender and thyme; others for their stimulating qualities, as mint and peppermint; others as aromatics, as savory, basil, and marjoram; several are used as febrifuges, as the *Cotinus viridis* of Sierra Leone. Rosemary is used in the manufacture of Hungary water, and its oil is that which gives the green color to bear's grease and like pomatums. Betony, ground-ivy, hoarhound, and others have bitter tonic qualities. Numerous species possess great beauty, as various kinds of sage, *Gardigita*, and *Dracocephalum*.

labiate (lā'bi-āt), a. and n. [= *F. labié* = *Sp. Pg. labiado* = *It. labiato*, < *NL. labiatus*, lipped, < *L. labium*, lip: see *labium*.] 1. a. Lipped; having parts which are shaped or arranged like lips.

labis (lā'bis), *n.* [*Gr. LGr. λαβίς, a spoon, Gr. a holder, handle, forceps, tongs, < λαμβάνειν, λαβεῖν, take.*] In the Greek and other Oriental churches, a small spoon, usually of silver, and with a cruciform handle, used to administer the eucharistic elements (the species of bread dipped in that of wine: see *intinction*) to the laity. The name is derived from the fact that the Greek word *labis* (λαβίς) is used in the Septuagint in the passage Isa. vi. 6 for the tongs with which the angel took the live coal from off the altar and gave it to the prophet, the 'live coal' being a frequent name in early Christian times for the eucharist. Before it was applied to the spoon, this name was given to the hand or fingers of the communicant. The *labis* is not in ordinary use in the Armenian Church. Also called *cochlear* and *eucharistic spoon*. See *spoon*.

labium (lā'bi-um), *n.*; pl. **labia** (-i). [*L., a lip, also labrum, a lip, prob. akin to E. lip: see lip.*] 1. In anat. and zool., a lip or lip-like part. Specifically—(a) In anat.: (1) Either lip, upper or under, of the mouth, respectively called *labium superius* and *labium inferius*. (2) Either lip, inner or outer, on each side of the vulva, respectively called *labium internum* and *labium externum*; generally named in the plural—the former, right and left, being the *labia minora* or *nymphæ*; the latter, right and left, being the *labia majora*. (3) Either lip, upper or lower, of the grooved border of the spiral lamina of the cochlea: the upper is called *labium vestibulare*, from its relation to the scala vestibuli; the latter, *labium tympanicum*, from its relation with the scala tympani. (b) In entom., specifically, the lower lip of an insect, the upper being called the *labrum*. It is morphologically the third pair of gnathites united together on the median line, and believed to correspond to the second pair of maxillæ of a crustacean. The labium is a composite organ, whose composition varies much in different groups of insects. Hence there is great confusion in the names of the parts of which it is composed. The term is now applied to the whole under lip, which may or does consist of parts named (1) stipes, mentum, and palpi, the palpi being bearing the lingua, paraglossæ, and palpi labiales; or (2) submentum, mentum, and ligula, the last bearing the glossæ, paraglossæ, and labial palpi. See these terms, and cuts under *mouth-part*.

It is hardly open to doubt that the mandibles, the maxillæ, and the labium answer to the mandibles and the two pairs of maxillæ of the crustacean mouth.

Huxley, Anat. Invert., p. 343.

(c) In *Arachnida*, the shield forming the floor of the mouth, which in spiders is very conspicuous, and is often, but incorrectly, called the *labrum*. (d) In *Arthropoda* generally, the lower lip, attached to the mentum; a coalesced second pair of maxillæ, forming the lower part of the mouth; the metastoma, as of a crustacean. See cut under *Arachnida*.

The resemblance between the labium and a pair of maxillæ which have coalesced is obvious.

Huxley, Anat. Invert., p. 347.

(e) One of the lips or labiate prolongations of the neuropodium of a polychæte worm, between which is the aperture of the trichopore. (f) In conch., the inner or columellar lip of a univalve shell, the outer lip being called the *labrum*. See cut under *univalve*. (g) The lip of an organ-pipe. See *lip*.

2. In bot.: (a) The lower or anterior lip of a bilabiate corolla. (b) In *Isodites*, a lip-like structure formed by the lower margin of the foveola. —3. It generally has a vertical motion, but may be immovably attached. The labrum covers and partly conceals the organs of the mouth; it is found in most insects, but in *Diptera* it is partly or wholly aborted. (b) In *Crustacea* and *Arachnida*, a lobe forming the upper border of the mouth. In the spiders this lobe is very small, and the term *labrum* is often applied incorrectly to the labium, or large shield forming the floor of the mouth. See cut under *Daphnia*. The evergreen or Nepallaburnum is *Pseudotsuga Nepalensis*. An intricate combination of passages running into one another from different directions, in which it is difficult or impossible to find the way from point to point, or to reach the place of exit from the interior, without a clue or guide; a maze. The name was anciently given to an edifice with a complicated system of passages connecting a great number of chambers. At the present day it is used especially of a geometrical arrangement of paths or alleys between high hedges in a park or garden, which lead confusedly back and forth, many of them ending in a cul-de-sac, but, when correctly followed, terminating in a central space, often occupied by a pavilion or the like. The most authentic and celebrated ancient labyrinth was that in Egypt near Arsiné or Crocodiopolis on Lake Mœris, having 3,000 rooms in two tiers, one of which was subterranean. The Cretan labyrinth, ascribed to Daedalus, was the abode of the fabled monster Minotaur. In medieval churches the labyrinth, formed of tiles or slabs of different colors in the pavement usually of the nave, was a frequent feature. Such labyrinths were formed on a square, circular, or octagonal plan, and were sometimes of such extent that it required 3,000 steps or more to follow their course. These labyrinths were considered emblematic of Christ's progress from Jerusalem to Calvary, and were followed with certain forms of prayer by the pious on their knees, either as a penance or in lieu of a pilgrimage. A number of them survive, as in the cathedrals of Chartres and Bayeux, France; but many of the most important have been destroyed, for the reason that, having become mere objects of curiosity, they furnished occasion for disturbances of the religious services. The best-known modern labyrinths are that of the garden of Versailles in France and "the maze" of Hampton Court near London.

3. The internal ear; the essential organ of hearing. It consists of a series of communicating cavities in the petrous portion of the temporal bone, called the osseous labyrinth, and of the membranous labyrinth contained in it. The osseous labyrinth consists of the cavity known as the vestibule, the three semicircular canals, and the cochlea. The vestibule communicates with the tympanum by the fenestra ovalis, which is closed by a membrane and the foot of the stapes. The fenestra rotunda opens from the beginning of the cochlea into the tympanum. It is closed by a membrane. See *ear*, *cochlea*.

This form of apparatus was formerly much more important than it now is.

6. The order has been divided into ten suborders, and is now broken up, its components being referred to several separate orders of the class *Amphibia*. The Labyrinthodonts were large, sometimes huge, aquatic animals, some exceeding 6 feet in length, with four limbs, belonging to the same class as toads, frogs, and salamanders, of very diverse lizard-like forms, and incapable of leaping. By some modern herpetologists, as Cope, the name is restricted to a suborder, referred to the order *Stegosauria*, and containing the families *Baphetidae* and *Anthracoecuridae*. Cf. *lake*, *lacker*, *laquer*.]

Labyrinthodon salamandroides (restored).

1. A resinous incrustation deposited on the twigs of various trees in India and southern Asia by the lac-insect, *Corticaria lacca*. The substance is formed by the mature female, from which it exudes, inclosing the eggs and keeping them attached to the branch. At the proper time the twigs are broken off by the native collectors, and exposed to the sun to kill the insect and to dry the lac. These twigs, with the attached resin, inclosed insects, and ova, constitute the *stick-lac*. Lac is a dark-red transparent resin, with a crystalline fracture, and bitter in taste. It yields only a part of its coloring matter to water, but borax solution exercises a special solvent power upon it. It is still much used in the East for dyeing woollen goods and leather, producing scarlet shades, not so brilliant as cochineal, but somewhat faster. *Seed-lac* is obtained from stick-lac by removing the resinous concretions from the twigs and triturating with water. The greater part of the coloring matter is dissolved, and the granular portion which remains after drying is the seed-lac. *Shell-lac* or *shellac* is obtained by melting the seed-lac in cotton-cloth bags, straining, and allowing it to drop on to sticks or leaves. In this way the resin spreads into thin plates, in which state it is found in commerce. It is used in the manufacture of spirit-varnishes and sealing-wax, and as a stiffening for hats. *Button-lac* differs from shellac only in form. In its melted state it is dropped into disk forms three inches in diameter and one sixth of an inch thick. *Lac-dye* is imported from India, and is probably prepared by extracting the coloring matter from stick-lac with a weak alkali to which alumina has been added. It is used like cochineal for dyeing scarlet on woollens, but has only half as much tinctorial strength. *Lac-lake* is obtained by treating stick-lac with caustic soda and alum. It has a limited use as an artists' color, producing results similar to cochineal carmines, though less brilliant. The extraction of the color from the resin leaves the shellac of commerce. The general term lac is extended to the similar secretion of any lac-insect.

2t. Lacquer.

3. Hence, any ornamental cord or braid used as an edging or trimming, especially when made of gold or silver thread. See *gold lace*, below.—4. A fabric of fine threads of linen, silk, or cotton, whether twisted or plaited together or worked like embroidery, or made by a combination of these processes, or (as at the present time) by machinery. Pillow- or bobbin-lace is made by a process intermediate between weaving and plaiting, from a number of threads which are kept in their places by the weight of the bobbins attached to them, and are woven and plaited together by hand. Needle-point lace is really embroidery, but is done upon loose threads which the worker has laid upon a drawn pattern, and which have no connection with each other and no stability until the needlework holds them together. (See *bobbin-lace*, *needle-point lace*, below.) Laces are known, according to kind, by many different names. See phrases below.

A stringer; beam. *Hallwell*.—**Albisola lace**, bobbin-lace made at Albisola, near Savona, in Italy, usually in free designs of scrollwork.—**Alençon lace**, a needle-point lace named from the city of Alençon in France. It is the only important French lace, except the Argentan, which is not made with bobbins. The fine

Alençon Lace (Point d'Alençon).

Alençon lace is usually considered as indistinguishable from Argentan; but it has more commonly a needle-made réseau or net. See *Argentan lace*.—**Antwerp lace**, a bobbin-lace resembling early Alençon, having a so-called pot introduced into the design—that is, a semicircle of a vase or basket constantly repeated. See *pot-lace*, below.—**Application-lace**, a lace made by sewing flowers or sprigs, which may be needle-made or bobbin-made, upon a bobbin-lace ground; especially, a Brussels lace of this kind, the most commonly made and the most important of all the Brussels laces.—**Appliqué lace**. Same as *application-lace*.

Argentan Lace.

Argentan lace is usually considered as indistinguishable from Alençon lace, but often holder and larger in pattern, with the solid parts or tollé flatter and more compact. It is also distinguished in some cases by a ground of hexagonally arranged brides.—**Arras lace**, a white bobbin-lace made at Arras in France, very strong, and inexpensive because of the simplicity of the pattern. The ground is that known as *Lille ground*.—**Aurillac lace**, a bobbin-lace made at Aurillac, department of Cantal, France. It was originally a close-woven solid lace, having much tollé, and resembling the guipure of Genoa and Flanders; later it resembled point d'Angleterre.—**Avignon lace**, lace made in Avignon. It is most commonly pure bobbin-lace, but of many different makes and patterns, as nearly all celebrated laces are imitated in this region.—**Ave Maria lace**, narrow lace used for edging. See *Diappe lace*.—**Baby lace**, a narrow lace used for edging, especially that made in Buckinghamshire and Bedfordshire, England, in very simple patterns.—**Basket-lace**, a lace mentioned in inventories of 1580, probably a braid or la-

cing so woven or plaited as to resemble basketwork.—**Bayeux lace**. (a) A modern bobbin-lace made at Bayeux in Normandy, especially that made in close imitation of rose-point. (b) A black-silk lace, in demand because made in unusually large pieces, as for shawls, scarves, etc.—**Beaded lace**. See *beaded*.—**Beggar's lace**. Same as *guirnee lace*. Mrs. Bury Porter. [Eng.]—**Billement lace**. See *billement*.—**Bisette lace**, a French peasant-lace made in narrow pieces, coarse and simple in design. The name has now become identified with narrow bordering-lace of small value.—**Bobbin-lace**, lace of which the threads are twisted or plaited together, without the use of the noodle. (See *def. 3*.) When the whole width of a large piece of lace is carried on together, the number of bobbins and of pins is very great and the work very expensive; but it is customary to work each branch or scroll separately, those being then tacked together on the ground by crocheting.—**Bobbin-net lace**, a kind of application-lace in which the pattern is applied upon a ground of bobbin-net or tulle.—**Bone-point-lace**, lace that has no regular ground of meshes. The name is of no definite significance, and has no connection with bone-lace.—**Border lace**, lace of any sort made in long narrow pieces having a footing on one side, the other edge being usually vandyked, purled, or the like.—**Bourg-Argental lace**, a blond-lace made in the latter part of the eighteenth century in Dauphiny, and considered of exceptional beauty, the silk used being especially fitted for the purpose.—**Bride-lace**, lace of which the ground is wholly composed of brides or bars, without a réseau or net.—**Broad lace**. See *brad*.—**Brussels lace**, lace made at and near Brussels in Belgium; especially, a lace of great fineness, of which the pattern has less relief

than Alençon, and the very fine net ground never has picots. At the present time Brussels lace is especially an application-lace, having needle-point sprigs and flowers sewed to a bobbin-ground, or in some cases bobbin-made or plat flowers applied to a needle-made ground or to tulle. In trade the name is often given to fine laces, no matter where made or of what pattern. Compare *point de gaze*.—**Buckingham lace**, a lace made originally in England, and of two kinds: (a) Buckingham trolly (which see, under *trolly*), and (b) a lace having a point ground, which is peculiar in having the pattern outlined with thicker threads, those threads being weighted by bobbins larger and heavier than the rest.—**Cadiz lace**, a kind of needle-point lace, considered as a variety of Brussels lace.—**Carnival lace**. See *carnival*.—**Cardisane lace**, guipure or passement made with cardisane, which is parchment or vellum in thin strips or small rolls, covered with silk, gold thread, or the like. See *guipure*.—**Caterpillar point-lace**. See *caterpillar*.—**Chain-lace**, a braid or passement so worked as to suggest links of a chain, used in the seventeenth century. It was made of colored silk, and also of gold and silver thread.—**Chantilly lace**, a kind of blond-lace of which the typical sort has a ground of Alençon réseau or net and the flowers in openwork instead of solid or mat. It is made of one kind of silk throughout, which is always grenadine or non-lustrous silk, so that black lace of this kind is often taken for thread-lace. Much Chantilly lace is made in the department of Calvados in France.—**Chenille lace**. See *chenille*.—**Cluny lace**, a kind of net-lace in which the stitch is darned upon a square-net background. The patterns used are generally antique and quaint, conventionalized birds, animals, and flowers; and the modern work of the kind is quite similar to that of the seventeenth century. A glass thread is sometimes introduced in the pattern as an outline or center line.—**Cordover lace** a kind of filling used in the pattern of ancient and modern point-lace.—**Cork lace**, Irish lace in general, especially of the older sorts, made principally in the city of Cork before the recent extension of this industry in Ireland.—**Croetan lace**. See *Croetan*.—**Crowl lace**. See *crowl*.—**Crochet lace**, lace made with the crochet-hook, or of which the pattern is made in this way but applied to a bobbin- or machine-made net. It resembles needle-point, although not equaling its finest kinds.—**Crown lace**, early lace, guipure, cut-work, and the like, in which royal crowns are introduced as part of the pattern. It appears first in the reign of Queen Elizabeth.—**Dalecarlian lace**. See *Dalecarlian*.—**Damascone lace**. See *damascone*.—**Darned lace**, a name given to lace of any kind which has a netted ground upon which the pattern is applied in needlework. Also called *fillet guipure*. See *def. 3*, *ground*, n., 10 (f).—**Guipure**, and *spider-work*.—**Devonshire lace**, lace made in Devonshire, England, especially that made in close imitation of Honiton.—**Diamond lace**, passement and gimp often mentioned in texts of the seventeenth century, apparently a silver or gold passement having losenges for the chief element in the design.—**Diappe lace**, a fine point-lace resembling Valenciennes, made at Diappe in France. In the eighteenth century there were several varieties of Diappe lace, bearing the popular names of *Ave Maria lace* and *dentelle à la Vierge*, the latter of which had a regular ground of squares composed of small meshes alternating with open squares, upon which ground the pattern, usually very simple, was applied in close-stitch or close-work.—**Dresden point-lace**. Same as *Swany lace*.—**Duchesse lace**, a variety of pillow-lace, originally made in Belgium and containing a great deal of the raised work, volants, and the like, which are used in the somewhat similar Honiton lace.—**Dunkirk lace**, a pillow-lace made in the seventeenth century, of which the more important kind was a close imitation of Mechlin, and was perhaps sold as such.—**Dutch lace**. See *Dutch*.—**Eern lace**. See *earn*.—**English point-lace**. (a) A bobbin-lace very much admired in the

eighteenth century, often mentioned in French documents of the time under the name of *point d'Angleterre*. It is generally said to have been of Flemish make, and to have been called "English" by English dealers in order to evade the law. Some writers, however, affirm its English origin. (b) At the present day, the finest Brussels lace, where needle-point sprigs are applied to Brussels bobbin-ground. See *application-lace*, above. — *False Valenciennes lace*. (c) Lace resembling Valenciennes, but without the true Valenciennes réseau. The surface and general character of the pattern closely resemble those of the true Valenciennes. (d) A general name for Valenciennes made in Belgium. — *Flat point-lace*, point-lace which has no raised work or embroidery in relief upon it. — *Flemish point-lace*, needle-point lace made in Flanders, especially the delicate sprigs used in Brussels lace. — *Frisian lace*. [*F. Frisian*, a bobbin.] Same as *bobbin-lace*. — *Genoa lace*, originally, gold and silver lace, for which Genoa was celebrated in the sixteenth and seventeenth centuries; at the present time, especially, lace made from vegetable fibers such as the aloë, and also macramé lace. — *Gold lace*, a kind of net-work, braid, or gimp, made antiently of gold or silver-gilt wire, and in modern times of silk thread, or cord covered by thin flat ribbons of gold wound around it. Gold lace is used chiefly as a decoration for uniforms, liveries, and some church costumes. — *Grammont lace*, one of two kinds of lace, usually expensive and used for shawls and the like: (a) A white pillow-lace, originally made at Grammont in Belgium. (b) A black-silk lace like blond-lace. — *Grosgrain lace*, a thread pillow-lace made in France during the seventeenth century. Also called *beaver's lace*. — *Henriettes lace*, a fine stitch or point, used alike in old and in modern needle-point work. — *Hollie-point lace*. See *hollie-point*. — *Honiton lace*, a lace made at Honiton in Devonshire, England, remarkable for the beauty of its figures and sprigs. — *Honiton application* is a lace made by working sprays, flowers, and other parts of a pattern on the lace-pillow and securing them to a net ground made separately. In modern manufacture, hand-made sprays are often sewed upon a machine-made ground. — *Honiton guipure* is a lace of large flower-pattern, with a very open ground, which is generally sold under the name of Honiton lace. — *Imitation lace*, machine-made lace of any kind. In fineness the imitation often rivals real lace; its chief defect is its mechanical regularity of pattern, which makes the design lifeless and uninteresting. — *Jessie lace*, a modern needle-point lace made in Ireland; so called from a tradition concerning the introduction of this manufacture since the famine of 1846. — *Knotted lace*. See *knotted*. — *Lille lace*, lace made at Lille in France, remarkable for its clear and light ground, which is known as *fond clair*, and is the most beautiful of the single-thread grounds, sometimes ornamented with points d'esprit. Old Lille lace has a peculiarly stiff and formal pattern. — *Limerick lace*, a kind of needlework upon machine-made net, worked in a tambour-frame. — *MacKin lace*. Same as *MacKin lace*. — *Mecklin lace*, a bobbin-lace which has the pattern outlined by a flat cord or band, narrow but very distinct. It is usually made in one piece, pattern and ground together. The ground is sometimes a réseau, or net, and when of this character is very varied in pattern, and sometimes formed of brides. — *Mignonette lace*, a light bobbin-lace with an open ground resembling tulip, made in narrow strips. Arras and Lille were famous for this in the eighteenth century. Also called *manuel lace*. — *Mirecourt lace*, lace made in the departments of Vosges and Meurthe-et-Moselle, France. (a) In the seventeenth century, a guipure, more delicate in texture and varied in design than other guipures. (b) At the present day, an application-lace, made of sprigs of bobbin-lace sewed upon grounds often made elsewhere, especially of the Alençon réseau. — *Needle-point lace*, lace made wholly with the needle. A pattern is first drawn, usually upon parchment; to this parchment is stitched a double piece of linen, and threads are then laid along the main lines of the pattern and sewed lightly down. Then the whole design is carried out, both solid filling and openwork, with delicate stitching, chiefly in the buttonhole-stitch. — *Oyale lace*, a sort of guipure lace or openwork embroidery made by means of a hook in a fashion similar to crochet. The pattern is often elaborate and in silks of many colors, representing flowers, foliage, etc. It is sometimes in relief. — *Parachment-lace*, lace in the manufacture of which parchment has been used, whether for the pattern used to guide the worker, as in needle-point lace, or for stiffening the fabric, as in cartisane lace. See *point de sein*, under *point*. — *Pillow-lace*, lace made on a cushion, both pattern and mesh being formed by hand. — *Platted lace*, a kind of pillow-lace of simple geometrical design, often made of stout and rigid strands, such as gold thread or even fine braid. — *Point-lace*. Same as *needle-point lace*. Many laces and grounds of lace are spoken of as *point*, but are not necessarily *point-lace*. See *point*. — *Pop-lace*, lace into the pattern of which a sort of vase or deep dish is introduced, or sometimes rather a basket, often having flowers in it. Compare *pot-plats*. — *Powdered lace*. (a) Lace of which the ground is strewn with small separate ornaments, whether flowers, or simple sprigs, or mere squares like points d'esprit. (b) Lace which has been whitened. See *powder*, s. v. — *Saxony lace*, fine-drawn work embroidered with the needle, greatly in favor in the eighteenth century; in modern times, lace of many kinds made in Saxony, especially an imitation of old Brussels. — *Seaming-lace*, a narrow openwork braiding, gimp, or insertion, with parallel sides, used for uniting two breadths of linen, instead of sewing them directly the one to the other; a device employed for curtains, cupboard-cloths, etc., and even for some garments, especially in the seventeenth century. The name is applied to a similar fabric when used in

Mecklin Lace.

other ways, as for edgings. — *Silver lace*, passement or guipure a large part of the whole of which is in silver wire, or thread wound with a thin flat ribbon of silver. Compare *gold lace*. — *Spanish lace*. (a) Needle-point lace brought from Spanish convents since their dissolution, but thought by some authorities to be of Flemish origin. (b) Cut and drawn work made in convents in Spain, of patterns usually confined to simple sprigs and flowers. (c) A modern black-silk lace with large flower-patterns, mostly of Flemish make. (d) A modern needle-made fabric, the pattern usually in large squares. — *Statute lace*, a fabric named in inventories of 1581, apparently gimp or passement made in conformity with sumptuary laws as to width and material. — *Tambour-lace*, a modern kind of lace made with needle-embroidery on machine-made net. It has been made especially in Ireland, and is generally included among Limerick laces. — *Tape lace*, a lace made with the needle except that a tape or narrow piece of linen is incorporated in the work and forms the chief patterns, the edges of it being often rolled up and stitched so as to form a sort of cordonnet. It is in imitation of the relief of rose-point. — *Thread lace*, lace made of linen thread, as distinguished from silk laces, such as blond, and modern cotton lace. — *Torches lace*, coarse bobbin-lace, made of stout and rather soft and loosely twisted thread. Most peasant-lace is of this sort, and an imitation of it is largely made by machinery. — *Trolley lace*. See *trolley*. — *Valenciennes lace*, a very durable bobbin-lace having the same kind of thread throughout for both ground and pattern. The pattern and ground are made together by the same hand; and as this involves the use of a great number of threads and bobbins, the price is very high. It is the dearest of all bobbin-laces. During the French revolution the manufacture was almost wholly removed to Belgium, where it still remains. — *Tyres lace*, a bobbin-lace resembling Valenciennes, sometimes having bolder designs and a rather large losenge mesh in the ground. (See also *blond-lace*, *bone-lace*.)

Green Lizard of Europe (*Lacerta viridis*).

number of common harmless lizards of the Old World, and chiefly of its warmer parts, of active diurnal habits, living on the ground chiefly, with four well-developed limbs and movable eyelids. They are of slender form, with long slim tail and non-imbricated scales. *L. agilis* is the common gray lizard or sand-lizard of England. *L. viridis* is the green lizard of southern Europe.

Lacertids (lā-sér'tid), *n. pl.* [*NL.*, < *Lacerta* + *-ids*]. The typical lizards, a family of true eriglossate lacertilians, exemplified by the genus *Lacerta*, belonging to the superfamily *Lacertoides* and order *Lacertilia*. They have clavicles not dilated proximally, parietal bones confluent, supratemporal fossæ roofed over, premaxillary single, and no osteodermal plates. The *Lacertids* are confined to the Old World, and are found chiefly in the warmer parts of Europe and Asia. They have a slender scaly body, with a long, fragile, tapering tail, well-developed limbs with 4 or 5 toes bearing claws, bright eyes with movable lids, slender forked protrusile tongue, and often brilliant or varied colors. The family includes, within the limits thus given, about 100 species belonging to 17 genera, most abundantly represented in Africa and by a few forms in India. None occur in America. *Lacerta agilis* and *L. (Zootoca) vivipara* are the British representatives of the family.

lacertiform (lā-sér'ti-form), *a.* [*L. lacerta*, *lacertus*, a lizard, + *forma*, form.]. Having the form of a lizard; lacertilian in structure.

Lacertilia (lā-sér'til'i-g), *n. pl.* [*NL.*, < *L. lacerta*, *lacertus*, a lizard: see *Lacerta*]. An order of reptiles, including the saurians proper or lizards, as the monitors, iguanas, geckos, chameleons, etc., and excluding the crocodiles. The order thus agrees with the old order *Sauria* divested of its non-conformable types. The *Lacertilia* have a scaly body mostly elongate, and usually 4 well-developed limbs, which, however, may be reduced to 2, or apparently to none, in which case there may be rudiments of a shoulder-girdle or hip-girdle. The vertebrae are biconcave in the *Gecconidae* and *Uroplatoidea*, but generally procircular, and have but one facet on each side for the articulation of the ribs, which are usually few in number, some of them being always attached to the sternum. The heart is tripartite, with two auricles and one ventricle. The anal cleft is transverse. The mouth is not dilatible, as it usually is in *Ophidia* or *Serpentes*, and the usually simple teeth are generally acro-

dont or pleurodont, not fixed in distinct sockets. The eyes are normally furnished with two or three movable lids. The animals are oviparous or ovoviviparous, mostly diurnal in habits, and agile in movement; they average but a few inches in length, with some signal exceptions, as among the monitors or varanoids and the iguanas. and used in creameries in connection with his centrifugal separator. A mixture of the milk to be tested with an equal volume of a mixture of 96 parts of strong acetic acid and 5 parts of strong sulphuric acid is heated for eight minutes in a glass or porcelain vessel. This process sets free the fatty substance of the milk, which, however, still remains diffused throughout the mass. The lactocrite is a long narrow-necked tube, fitted to a holder on a disk attached to the centrifugal separator. The prepared milk is placed in this tube, and the rotation of the centrifugal separator acts, as in the separation of cream from milk, to aggregate the fat in the narrow neck of the tube, when its quantity can be determined by a scale. When all the steps of the process are performed with exactness, the value of the sample for butter-making can be determined with an average error of only one twentieth of one per cent.

Lactodensimeter (lak'tō-den-sim'e-tēr), *n.* [*L. lac(t-)*, milk, + *densus*, thick, dense, + *Gr. μέτρον*, a measure.] A kind of lactometer furnished with scales intended to show what proportion of the cream, if any, has been removed from a sample of milk by skimming.

Lactometer (lak-tom'e-tēr), *n.* [= *F. lactomètre* = *Sp. lactómetro* = *Pg. lactómetro*, < *L. lac(t-)*, milk, + *Gr. μέτρον*, a measure.] An instrument for gaging the purity or richness of samples of milk. Specifically—(a) An instrument used in measuring the volume of cream in a sample of milk, and the probable amount of water, if any, which has been added to it. The simplest form is a graduated glass tube for measuring the amount of cream that rises from a sample of milk placed in it. A more complete instrument consists of a series of tubes each with a stop-cock at the bottom, arranged vertically in a suitable stand. The tubes are about an inch in diameter and 12 inches high, and are graduated to tenths of inches. The samples of milk to be tested are poured into separate tubes to a depth of 10 inches. The stand is then set aside and the cream allowed to rise. The thickness of the stratum of cream which rises is measured in tenths of an inch, or (as the depth is 10 inches) in hundredths of the volume tested. The separated milk is then drawn off through the stop-cock for further tests of richness in caseous matter, etc. (b) A kind of hydrometer for testing milk by its specific gravity; also called *galactometer* to distinguish it from the preceding, in connection with which it is commonly used. When this is called *lactometer*, the other instrument receives a different name, as *cremometer* (*Encyc. Brit.*), or *per cent. tube* (*B. H. Knight*). See *hydrometer*, and out under *galactometer*. (c) Same as *lactodensimeter*.

Lactoscope (lak'tō-skōp), *n.* [*L. lac(t-)*, milk, + *Gr. σκοπεῖν*, see.] An instrument for testing the quality and richness of samples of milk, by their comparative opacity, constructed and operated upon the principle that the richer the milk is in fatty and caseous substances the greater will be its resistance to the passage of light through a stratum of any given thickness. The samples are tested by a light of equal intensity, usually the flame of a stearin candle. A common form of lactoscope may be described as a box with two vertical parallel and polished glass sides, one of which may be moved by a screw toward or away from, and always in parallel relation with, the other. The candle is placed at a specified distance from the fixed glass side of the box, and as the movable side recedes the stratum of milk increases in thickness to a point at which the candle-flame becomes invisible through it. The various thicknesses at which this occurs in different samples are indications of the richness of the samples, provided no adulteration other than watering has been attempted. There are also lactoscopes of simpler construction and operation. (*Encyc. Brit.*)

Lactose (lak'tōs), *n.* [*L. lac(t-)*, milk, + *-ose*.] Sugar of milk, $C_{12}H_{22}O_{11}$, obtained by evaporating whey, filtering through animal charcoal, and crystallizing. It forms hard, white, semi-transparent trimetric crystals, which are less soluble than cane- or grape-sugar, have a slightly sweet taste, and grate between the teeth. It is dextrorotatory, and ferments slowly with yeast, but readily undergoes the lactic fermentation. It is convertible into glucose and galactose by boiling with dilute sulphuric acid. It is used for food and in medicine, and is prepared as an article of commerce in Switzerland and Bavaria. Also called *galactine*, *lactine*, and *milk-sugar*.

lagoon (la-gūn'), *n.* [Also *lagune*, two forms of same ult. origin being concerned: (1) Also written *lagune* (= F. *lagune*), < It. *laguna* = Sp. *laguna*, Pg. *lagoa*, < L. *lacuna*, a ditch, lake, < *lacus*, lake; (2) It. *lagone*, a pool, aug. of *lago*, a lake, < L. *lacus*, a lake: see *lacuna*, *lake*.] 1. An area of shallow water, or even of marshy land, bordering on the sea, and usually separated from the region of deeper water outside by a belt of sand or of sand-dunes, more or less changeable in position. Such areas are chiefly formed at the mouths of rivers which bring down considerable detrital material from adjacent elevated land—this detritus in course of time forming a complicated network of ridges separating tracts covered by shallow water, which, as the process of filling goes on, tend to become converted first into marshy and finally into dry land. The best-known lagoons are those near the head of the Adriatic, on its western side, on the outer edge of which is situated Venice, often called the "City of the Lagoons" (la città delle lagune). The tendency of the Brenta and other small streams coming from the Alps to fill up the Venetian lagoons is so powerful that it is only by persistent and costly works of hydraulic engineering that the city has to a certain extent retained its position unchanged. A somewhat similar condition prevails at the mouth of the Rhone, where, however, the lagoons are called *delta*. On the southern coast of the Baltic considerable areas of the shal-

low sea (called *Hafte*) are closed in by long crescentiform sand-banks (*Nehrungen*); but the conditions here are quite different from those at the head of the Adriatic, since the streams flowing over the plains of North Germany are not torrential in character. Lagoons are found in great numbers along the coast of Brazil, formed there as elsewhere by the conflict of large detritus-bearing rivers with the ocean waves and tides. In regions where Spanish is or formerly was the current language, the word *lagoon* is likely to be used with more latitude of meaning, since in the Spanish language *laguna* is applied to ordinary lakes, to the bottoms of deep bays, especially when these are more or less closed in by a narrowing of the coast-lines, so as to give rise to lake-like areas, and also to shallow, swampy, or almost dried-up lakes inland as well as near the coast.

2. With reference to Tuscany and some other parts of Italy, the basin of a hot spring, especially one from which borax is obtained: from the Italian use of *lagone* in this sense.

Cf. *lache*², *latch*², *leach*², a pit, etc.] 1. A body of water surrounded by land, or not forming part of the ocean and occupying a depression below the ordinary drainage-level of the region. Lakes are depressions or basins filled by streams flowing into them, the water thus introduced generally accumulating until it runs over at the lowest point of the edge of the depression, and then flowing to the sea. But in some cases a river may fill a number of such depressions in succession before reaching the sea, as is very notably the case with the chain of lakes and rivers beginning with Lake Superior and ending in the Gulf of St. Lawrence. The larger depressions which when filled with water become lakes are ordinarily orographic in character—that is, they owe their origin to movements of the earth's crust, in the same manner as mountain-ranges. Many smaller lakes, however, especially the shallower ones, fill depressions which have originated from local or less general causes, as when produced by unequal decay or erosion of rocks, or by irregular distribution of surface detritus. The existence of a depression being given, the question whether it shall be entirely filled with water is one of climate. In regions of small rainfall and large evaporation, depressions occur which do not become filled with water, and consequently do not furnish any surplus which shall overflow and run to the sea. Such regions, having no drainage to the sea, are called *closed basins*, and there are very large areas of this character in Asia and North America, and smaller ones elsewhere. The water in the lakes occupying the lowest portion of such depressions is always more or less saline, because that which is brought in leaves as it evaporates a constantly accumulating store of the saline matters which it holds in solution. The Caspian Sea is properly a salt lake; and some lakes are excessively salt, as the Great Salt Lake in Utah and the Dead Sea (also properly a lake). There are lakes of considerable size, as several in Canada, which have no visible inlets, being fed entirely from subterranean sources.

Ye elves of hills, brooks, standing lakes and groves.

lake³ (lāk), *n.* [*F. laque*, lac, < *Pers. lāk*, lake, < *lak*, lac: see *lac*².] A pigment formed by absorbing animal, vegetable, or coal-tar coloring matter from an aqueous solution by means of metallic bases. The general method of preparation is to add an alkali solution to an infusion of the substance affording the desired color, as madder, cochineal, logwood, or quercitron. To this is added a solution of common alum, producing a precipitate of alumina, which in settling carries with it the coloring matter, thus forming the lake. As paints, lakes lack body, and are mostly used in glazing over other colors. From cochineal is prepared carmine, the finest of the red lakes. *Crimson lake* is a cochineal lake containing more aluminous base than carmine. *Carminated lake* is the cheaper and weaker lake made from cochineal after the carmine has been extracted. *Scarlet lake* is prepared by mixing vermilion with crimson lake. *Purple lake* is a species of crimson lake with a purple hue. *Madder lakes* are produced by precipitating the coloring matter of the madder-root with an alumina base. They range in color from light pink through red to brown and purple. *Indian lake* is the same as *lac-lake* (which see, under *lac*²). *Yellow lake* is made from quercitron-bark, sometimes from Persian or French Avignon berries. *Green lake* is compounded by adding Prussian blue to yellow lake. *Citrine lake* is an obsolete term for brown pink. *Burnt lake* is obtained by partially charring crimson lake. From logwood are obtained lakes of various shades of deep-brownish red, as *rose lake*, *Florence lake*, *Florentine lake*, etc. From certain of the coal-tar colors are obtained lakes almost identical in color with cochineal and madder and equal in permanency.

In the Swiss lakes, as in most other examples, a number of dwellings, forming a lacustrine village, were built together on a platform resting either upon piles or upon layers of fascines supported by stakes, and appear generally to have been connected with the shore by a bridge. Many implements of bone, flint,

bronze, and iron, pottery, and other objects, and some human remains, have been found in these ancient deposits. Similar habitations are still used in various parts of the world. The caudal fin is slightly forked; the dorsal rather low. It is extremely variable in size, coloration, and character of the scales. It may be generally recognized by the profusion of small round black spots on most of the body, and a red blotch on the lower jaw. It is regarded as the parent stock of several varieties of black-spotted trout. It abounds in the rivers of Alaska, Oregon, and Washington, there descending to the sea, and sometimes attains a weight of 20 pounds; it is also found in the Yellowstone and upper Missouri regions, the Great Basin of Utah, in Colorado, and in the upper Rio Grande. The Waha lake-trout of Washington is a variety (*boulengeri*) of this species. Another variety, found from the Kansas to the upper Missouri, is called var. *sonnisi*. A third is var. *henshawi*, the silver or black trout of Lake Tahoe, Pyramid Lake, and the streams of the Sierra Nevada. The valves of the shell are connected and close over the back of the animal by a hinge; they are also generally united by one or two muscles, called *adductors*, which penetrate the body-mass. Opening of the shell is effected by an elastic ligament in or about the hinge. The shell is secreted by a prolongation of the integument called

the mantle or pallium, which laps round the body, its halves being either free or united so as to leave only three apertures for the inlet and outlet of water for respiration, and for the protrusion of a fleshy organ called the foot, when it is present. The muscular edge of the mantle leaves on each valve an impression called the *palatal line*. Respiration is generally effected by lamellated gills (whence the name), usually occupying a large part of the interior of the shell on each side. The mouth is a simple jawless fissure, furnished with one or two pairs of soft palpi, the food being conveyed to it by cilia on the gills. The heart has a single ventricle pierced by the intestine, and there are three double nerve-centers. The group was originally designated by the author of the name (De Blainville, 1814) as an order, but has generally been adopted as a class of Mollusca, containing all the true or ordinary bivalve mollusks, of

Vertical Transverse Section of *Anodonta* through the heart.

See *lamina ventrales*, above.—(an) *Lamina, lamella*. In zoology and anatomy these words are usually absolutely synonymous, used interchangeably and without distinction. If there be a possible distinction, it is that *lamella* may often apply to something smaller or thinner than a *lamina*: for instance, the cover of a book is a *lamina*, containing leaves or *lamellae*. Haeckel draws and maintains this distinction in embryology.

Their fronds are coriaceous and not articulated, and attached to the sea-bottom by a root-like or sometimes disk-like organ, whence arises a stipe, which expands into a lamina or blade. They are propagated by means of zoospores, borne in zoosporangia on the surface of the frond, either diffused or in patches. laminating-machine (lām'i-nā-ting-mā-shēn'), *n.* In *metal-working*; a machine for making metallic sheets; in particular, a set of gold-beaters' rolls arranged in a frame with gearing and adjustable bearings, the adjustment of the bearings being effected by screws, and the rollers being turned by a winch. The gold ingot is by this machine (with frequent annealing to prevent cracking) reduced to a ribbon weighing 6 grains per inch, which is cut into pieces about one inch square to form the gold-beaters' pack, the beating of which, again with frequent annealing, reduces the metal to gold-leaf.

laminating-roller (lām'i-nā-ting-rō'lēr), *n.* In *metal-working*, one of a set of rollers in a rolling-mill, for reducing forgots or blooms to sheets or bars. The rollers act in pairs, and their distance apart determines the thickness of the sheet. This distance is regulated by adjustable bearings moved accurately by screws. For bars the rollers are grooved in accordance with the required shape of the cross-section. The blooms or forgots are rolled hot; but cylindrical bars for shafts are in some manufacturing finished by cold-rolling.

lamination (lām-i-nā'shōn), *n.* [*laminare* + *-ion*.] The act of laminating, or the state of being laminated; arrangement in layers or thin plates; specifically, in *geol.*, a division of rock into layers or laminae: nearly the same as *stratification*. A stratified rock may or may not be laminated. In the former case each stratum or bed is capable of being divided into thin layers or laminae. Lamination is hardly possible except in rocks made up of fine-grained materials. The break or interval separating two strata is more evident, and very probably was of longer duration, than that which intervened between the deposition of two successive laminae. Some English geologists use the term *lamination* with reference to the crystalline and eruptive rocks, making *laminated structure* the equivalent of *foliated structure*, where this has been the result not of stratification but of contraction during the process of cooling, or of some other cause connected with the formation of masses of igneous origin.

Four kinds of fissility may be recognised among rocks: 1st, *lamination* of original deposit; 2d, cleavage, as in slate; 3d, shearing, as near faults; 4th, foliation, as in schists. A. Geikie, *Text-Book of Geol.* (2d ed.), p. 463.

Though ye may think him a lamiter, yet, grippie for grippie, friend, I'll wether he'll gar the blude spin fine under your nails. *Scott, Black Dwarf, xvii.*

Lamium (lā'mi-um), n. [NL. (*Linnæus*), < *L. lamium*, the dead-nettle.] A genus of labiate plants of the tribe *Stachydeæ*, type of the subtribe *Lamioæ*, with nearly equal, not acerose calyx-teeth, the corolla-tube rarely exerted, the anther-cells generally parallel, and the nutlets angled and truncated at the apex. They are annual or perennial herbs, often diffuse or decumbent at the base, with cordate toothed or incised leaves, and densely many-flowered whorls of flowers crowded at the summit of the stem. The irregular pale flowers are sometimes large, and generally pink or purple, sometimes white or even yellow. There are nearly 40 species of these plants, inhabiting Europe, northern Africa, and extratropical Asia. Several species are common as weeds in waste ground, and some are occasionally cultivated in gardens. They are all known by the name of *dead-nettle* or *hedge dead-nettle*. The best-known species are the white-flowered *L. album*, the pink- or purple-flowered *L. purpureum*, *L. amplexicaule*, and *L. maculatum*, and the yellow-flowered *L. Galeobdolon*.

'bread-feast' (see *def.*), < *hlaf*, loaf, bread, & *mæsse*, mass: see *loaf* and *mass*.] 1. Originally, in England, the festival of the wheat-harvest, observed on the 1st of August, corresponding to the 12th in the modern calendar. It is supposed to have taken its name from the practice of offering first-fruits at the service of the mass on that day, in the form of loaves of bread. The festival was a continuation of a similar one from pagan times. Some have supposed, erroneously, that the name has some connection with the word *lamb*.

And to the lammasse afterward he spouse the quene. *Rob. of Gloucester, p. 317.*

2. In Great Britain, the 1st of August as a date, which in Scotland is a quarter-day and in England a half-quarter-day. The prevalence of this use, both in ancient and modern times, has to a great extent obscured the original significance of the word. Also called *Lammas-day*.

3. The church festival of St. Peter's Chains, or St. Peter in the Fetters, observed on August 1st in memory of St. Peter's imprisonment and miraculous deliverance (Acts xii, 4-10).—*Lammas eve*, July 31st, the day before *Lammas*.

The light is produced by throwing a jet of hydrogen gas upon recently prepared spongy platinum, when the metal instantly becomes red-hot, and then sets fire to the gas. This action depends upon the readiness with which spongy platinum absorbs gases, more especially oxygen gas. The hydrogen is brought into such close contact with oxygen (derived from the atmosphere) in the pores of the platinum, with evolution of sufficient heat to ignite the rest of the hydrogen. Also called *hydrogen lamp*.—**Electric lamp**. See *electric* and *glow-lamp*.—**Fresnel lamp**, a lamp in which the light is placed behind a Fresnel lens, or is inclosed in a glass of which the section is that of a Fresnel lens.—**Hydrogen lamp. Reservoir and burner are carried on an upright standard passing through the tube, and can be raised or lowered on the standard at pleasure. The burner is fitted with a tall chimney and a conical porcelain shade.—**Submarine lamp, any form of lamp designed to burn under water. It is now particularly an electric light that may be suspended under water for lighting wrecks or submarine explorations, constructions, etc.—**Sun lamp**, a form of electric incandescent lamp, resembling an arc-lamp, the light being given out by a piece of lime, magnesia, or other refractory substance, placed between the ends of two carbon rods and rendered incandescent by an electric current.—**To smell of the lamp**, to show traces of the use of "midnight oil"; bear the marks of great and protracted labor; be labored and pedantic in style or abstruse in character: said of literary work.**

The less destructive land-slides occur when gravel, sand, and other detrital material resting on a slope become so permeated with water that they can no longer resist the action of gravity. The more destructive land-slides are generally due to the slipping of a part of the solid rock of the mountain, in consequence of the softening of some more permeable layer in a mass of which the strata have a suitable inclination. Some such land-slides have been appalling in their results; as, for instance, that which took place at Plura, north of Lake Como, in 1618, by which many persons perished, and stately buildings were buried to a depth of 100 feet or more. The falling of part of the eminence called Cape Diamond in Quebec in 1899 destroyed many buildings and many lives. The word *land-slide* is occasionally used for *land-slide*, as also the term *rock-avalanche*. Also called *earth-fall*.

He will get himself . . . slain by a *land-slide*, like the agricultural King Ounad.
Emerson, *Eng. Traits*, iv.

Hence the name is occasionally applied to intermittent springs, especially such as characterize the chalk districts of England.

All the shallow surface springs, from ten to twenty feet deep, are produced by water which has fallen on and passed through this gravel down to the top of the London clay, on the irregular surface of which it is held up. These are called *land-springs*, and they constituted, formerly, a principal source of supply to London.

In Austria the landsturm consists of men who have passed the landwehr and are bound to this service further for 10 years. Men who have served as officers in the regular army or the landwehr are liable for service in the landsturm also up to the age of 60. The landsturm of Switzerland comprises every male citizen between the ages of 17 and 60 not otherwise serving in the army. The *landwehr* corresponds indirectly to the militia of Great Britain and the United States. In Germany it consists of men who have served in both the regular army and the reserves. It possesses a complete military organization, but is not called out in time of peace, unless at intervals for practice. In time of war or other national danger the *landwehr* is summoned in two levies: first, those from 28 to 33 years old, who take the place of the reserves; second, those from 33 to 38, who are assigned to garrison duty. L. and *ML.* word being *lingua*), < *L. lingua* (> *It. lingua* = *Sp. lengua* = *Pg. lingua*, *lingua* = *F. langue*, the tongue, a tongue, language, = *E. tongue*: see *tongue*.] 1. The whole body of ut-
tered signs employed and understood by a given
community as expression of its thoughts; the
aggregate of words, and of methods of their com-
bination into sentences, used in a community
for communication and record and for carrying on
the processes of thought: as, the English lan-
guage; the Greek language. The languages of the
world, each of them unintelligible to the speakers of any
other, are very numerous, rather exceeding than falling
short of a thousand. Of these, each individual (without
reference to his race) acquires for his first language or
"mother-tongue" that one which he hears used by those
about him in childhood, as he may later learn some other,
even to the substitution of it for his "mother-tongue"
and oblivion of the latter. Many languages are related
with one another—that is, there is such correspondence
in their words and forms as shows them to have descend-
ed from a common ancestor, or to have reached their
present form by gradual divergent alteration of the same
original language, since, by the action of its speakers,
every living language is undergoing constant change. A
body of languages thus related is called a *family* or *stock*;
and the classification of all human tongues into families
is one of the most important results of the study of lan-
guage. Families then are divided into subordinate divi-
sions called *groups*, *branches*, *subbranches*, or the like. Ex-
amples of families are the *Aryan* or *Indo-European*, the
Semitic, and so on. (See the various names.) With refer-
ence to their relationship to a larger class, languages are
also called *dialects*: thus, Yorkshire and Scotch are *dia-
lects* of English; English and Dutch are Low-German *dia-
lects*; German, Slavonic, Celtic, etc., are *Aryan dialects*.
(See *dialect*.) Languages differ not only in material, but
also in regard to structure, or the apparatus of forms,
connections, auxiliaries, etc., by which the modifications
and relations of ideas are expressed. Some are more syn-
thetic, some more analytic; some are isolating, or desti-
tute of formal distinctions, whether of parts of speech
or of inflections; some are agglutinative, or have words
made up of parts rather loosely joined together; some
have their words, or part of them, more completely in-
tegrated, to the complete disguise of their original con-
stituents, and even, in greater or less part, the substitution
of an internal change (as in *sing, sang, sung, song*) for an
external (as in *love, loved, loving, lover*). This character-
istic is called *inflection*, and is seen in highest degree in
two of the families (*Aryan* and *Semitic*) mentioned above.
(See *agglutinative*.) Languages are usually designated by
an adjective formed (in *-ish*, *-an*, *-ese*, *-ic*, *-al*, etc., or
without any termination) from the name of the country or
people (such adjective used alone, as a noun, being the
particular name of the language), as *English*, *Spanish*,
Scottish, *Scotch*, *Dutch*, *Welsh*, *French*, *Italian*, *Russian*,
Chinese, *Maltese*, *Gaelic*, *Arabic*, *Latin*, *Greek*, etc.; but
the name is often of other origin or formation, as *Sanskrit*,
Prakrit.

In that land of Caldee, thei han here propre *Langages*,
and here propre *Lettres*. *Manderiville, Travels*, p. 158.

After a speech is fully fashioned to the common under-
standing, & accepted by consent of a whole country &
nation, it is called a *language*.

Puttenham, Arte of Eng. Poetrie, p. 120.

2. Power of expression by utterance; the capac-
ities and impulses that lead to the production
and use of languages; uttered expression; hu-
man speech considered as a whole: as, *language*
is the peculiar possession of man.

You taught me *language*; and my profit on 't

Is, I know how to curse. *Shak., Tempest*, l. 2. 302.

The ends of *language* in our discourse with others
being chiefly these three: First, to make known one man's
thoughts or ideas to another; secondly, to do it with as
much ease and quickness as is possible; and thirdly, there-
by to convey the knowledge of things. *Language* is either
abused or deficient, when it falls in any of these three.

Locke, Human Understanding, III. x. 28.

3. The words or expressions appropriate to or
especially employed in any branch of knowl-
edge or particular condition of life: as, the
language of chemistry; the *language* of common
life.—4. The manner of expression, either by
speech or writing; style.

With good example and faire *language*

His fair taught him well and faire.

Babees Book (E. E. T. S.), p. 48.

Their *language* simple, as their manners meek,

No shining ornaments have they to seek.

Cooper, Hope, l. 764.

Hence—5. The inarticulate sounds by which
irrational animals express their feelings and
wants: as, the *language* of birds.

Choughs' *language*, gabble enough, and good enough.

Shak., All's Well, iv. l. 22.

6. The expression of thought in any way, ar-
ticulate or inarticulate, conventional or uncon-
ventional: as, the *language* of signs; the *lan-
guage* of the eyes; the *language* of flowers.

Yes, lie upon her!

There's *language* in her eye, her cheek, her lip;

Nay, her foot speaks. *Shak., T. and C.*, iv. 5. 58.

To him who in the love of Nature holds
Communion with her visible forms, she speaks

A various *language*. *Bryant, Thanatopsis*.

The word *language*, in its most limited application, is restricted to human articulate speech; but in its metaphorical use it embraces every mode of communication by which facts can be made known, sentiments or passions expressed, or emotions excited.

G. P. Marsh, *Lect. on Eng. Lang.*, II.

74. A people or race, as distinguished by its speech; a tribe.

All the people, the nations, and the languages, fell down and worshipped the golden image. Dan. III. 7.

Ten men . . . out of all languages of the nations . . . shall take hold of the skirt of him that is a Jew. Zeck. viii. 23.

Dead language, a language which is no longer spoken or in vernacular use by a people as the traditional and native means of expression. Some dead languages have disappeared, leaving no representatives, as the Etruscan and Egyptian; others have been succeeded by tongues descended from them and more or less resembling them, as Latin and Anglo-Saxon; some, by an artificial process of instruction, are still learned and used for writing and speaking, like Latin, Sanskrit, and Hebrew.

The languages, especially the dead,
The sciences, and all the most abstruse.

Byron, *Don Juan*, l. 40.

Flash language. See *Flash*.—**King's language**. See *King*.—**Low language**. See *Low*.—**Living language**, a language still spoken or in vernacular use by a people.

Now the Coptic is no more a *living language*, nor is it understood by any, except that some of the priests understand a little of their liturgy, who many of them cannot so much as read it, but get their long offices by rote. Pococke, *Description of the East*, I. 245.

The bow-wow and pooh-poo theories of language, nicknames applied to the theories which recognize, respectively, imitations of natural cries and interjections as the first beginnings of language.—**Syn. 1. Language, Dialect, Idiom, Diction, Vocabulary**; tongue. The first five words are arranged in a descending scale. In common use it is taken for granted that the *dialects* under one language are enough alike to be reasonably well understood by all who are of that language, while different languages are so unlike that special study is needed to enable one to understand a language that is not his own; but this is not an essential difference. *Idiom*, literally a personal peculiarity, is in this connection a form of a language somewhat less marked than a *dialect*; as, the New England *idiom*. *Diction* is often used for the set of words or vocabulary belonging to a person or class, making him or it differ in speech from others; but both this and *idiom* are often expressed by *dialect*. (See *Diction*.) *Vocabulary* means the total of the words used by a person, class, etc., considered as a list or number of different words; as, he has a large vocabulary. In this respect it differs from another meaning of *idiom*—that is, any peculiar combination of words used by a person, community, nation, etc.

Every class (in the community), however constituted, has its dialectic differences; . . . each trade, calling, profession, department of study, has its technical vocabulary. . . . The highly cultivated have a *diction* which is not in all its parts at the command of the vulgar. . . . We must notice . . . the meaning of the terms *language* and *dialect* in their relation to one another. They are only two names for the same thing, as looked at from different points of view. Any body of expressions used by a community, however limited and humble, for the purpose of communication and as the instrument of thought, is a *language*. . . . On the other hand, there is no tongue in the world to which we should not with perfect freedom and perfect propriety apply the name of *dialect* when considering it as one of a body of related forms of speech.

Whitney, *Life and Growth of Lang.*, pp. 155, 176-8.

In Rom. antiq.**, one of a class of infernal deities whose cult was of primitive origin. They were looked upon as natural protectors of the state and family, and also as powerful for evil if not duly respected and propitiated. The public *Lares*, originally two in number, were the guardians of the unity of the state, and were honored with temples and an

elaborate public ceremonial. After the time of Augustus, at least, each division of the city had also its own public *Lares* (*Lares compites*). The private *Lares* differed for each family, and were worshipped daily in the house, being domiciled either on the family hearth or in a special shrine. They received also special recognition upon every occasion of festivity, public or private, and on certain days devoted particularly to them, and claimed tribute alike from the bride upon entering the family and from the youth upon attaining his majority. The chief of the private *Lares* in each family, the domestic or household *Lar* (*Lar familiaris*) in the fullest sense, was the spirit of the founder of the family. To the family spirits were often added in later times, among the household *Lares*, the shades of heroes, or other personalities who were looked upon with admiration or awe. In their character as malignant divinities, the *Lares* were commonly classed under the titles of *lemures* or *larvae*.

The *AS.* term was *bacboord*: see *etym.* of *backboard*. It is not clear why this term, which remains in other Teut. tongues, gave way in *E.* to *larboard*. Cf. *starboard* (ult. < *AS. stædbōrd*, < *stædr*, steer, rudder, + *bord*, side). The supposition that *larboard* stands for **lower-board*, i. e. left side (*D. laager*, lower, left; cf. *E. obs. higher*, right), is untenable; and the statement that *larboard* and *starboard* are derived, respectively, from the (supposed) *It.* terms *quella borda*, 'that side,' *questa borda*, 'this side,' is gross nonsense.] **I. n.** *Naut.*, that side of a ship which is on the left hand of a person facing the bow: opposed to *starboard*, the right-hand side. According to some recent authorities, conversion with felonious intent may be larceny although there was no intent to appropriate the thing to the use of the thief himself. At common law appropriation by an employee or bailee already in lawful possession was not larceny, but at most embezzlement. By modern statute, in several jurisdictions acts formerly amounting only to embezzlement have been made larceny.

2. In *zool.*: (a) The early form of any animal which during its development is unlike its parent: thus the tadpole, the larva of the frog, is unlike the frog. It is most familiar as the name for an insect in the caterpillar or grub state; the first stage after the egg in the metamorphoses of insects, preceding the pupa or chrysalis; the first condition of an insect at its issuing from the egg, when it is usually in the form of a grub, caterpillar, or maggot. The term was applied by *Linnæus* in the sense that the larval stage of an insect masks or hides the true character or image of the species. It was long only or chiefly an entomological term, but is now commonly extended to other animals than insects, and especially other arthropods which undergo transformation. larynx (lar'inks, n.; pl. *larynges*, rarely *larynges* (lā-rin'jēs, lar'ink-sez). [NL., < Gr. *larynx* (ἀρύνξ), the upper part of the windpipe, also the throat, gullet.] The part of the windpipe in which vocal sound is made and modulated; the organ of phonation. In man the larynx is the enlarged and modified upper end of the trachea, with some associated parts, as the epiglottis. It opens by the glottis into the pharynx; below, its cavity is directly continuous with that of the trachea or windpipe. It causes the protuberance of the throat called *Adam's apple* or *prominent Adam's*. The framework of the larynx is cartilaginous, and composed of nine cartilages—namely, the *thyroid*, the largest, in two symmetrical halves, forming most of the walls; the *cricoid*, the enlarged upper ring of the trachea; a pair of *arytenoids*, small pyramidal pieces; a pair of *cornicula laryngis* or *cartilages of Santorini*; a pair of *uncinate form cartilages* or *cartilages of Wrisberg*. From the ary-

tenoid cartilages, which sit on the posterior part of the cricoid ring, three folds of membrane pass forward on each side: above and from the tips of the arytenoids, inclosing the cornicula laryngis and cartilages of Wrisberg, the aryteno-epiglottic folds pass to the lateral margins of the epiglottis; next below, the false vocal cords run from the anterior surface of the arytenoids to the angle between the two halves of the thyroid, while below this again the true vocal cords are attached behind to the vocal processes of the arytenoid and in front are inserted close to the angle of the thyroid below the insertion of the false vocal cords. The true vocal cords bound the anterior two-thirds of the glottis, the posterior third lying between the arytenoid cartilages. Between the true and the false vocal cords on each side there is a recess called a ventricle or sinus of the larynx, which leads into a pouch, the *sacculus laryngis*. The nerves of the larynx are branches of the vagus. The larynx acts at once as a gate guarding the windpipe and as a vocal organ. It is closed by the approximation of the three mucous folds of one side to those of the other, the epiglottis contributing to the closing of the gap between the aryteno-epiglottic folds. In phonation the arytenoid cartilages are swung around so as to close the rima respiratoria and to bring the vocal cords close to one another and parallel. The vocal cords are drawn taut by intrinsic laryngeal muscles, according to the height of pitch desired. The larynx is larger in men than in women and boys by about one third. The average length of the vocal cords is $\frac{1}{4}$ of an inch in men, $\frac{1}{5}$ in women; of the alt of the glottis, $\frac{1}{4}$ in men, $\frac{1}{5}$ in women. The cracking of the voice in boys at the approach of puberty is due to the rapid growth and change of shape of the larynx: the size is almost doubled in two or three years. In various animals the larynx may be situated anywhere along the windpipe, or even in the bronchial tube. It is generally at the top of the trachea. In birds there are two larynges, one at the top, the other at the bottom of the trachea. The latter is called the *syrix*. When the syrix is still more inferior in position it is wholly bronchial; then there are a pair, right and left, making, with the one at the top, three larynges. See out under *mouth*.

The site so named belonged in the first century to the family of the *Laterani*, was confiscated by Nero, and given by Constantine to the Bishop of Rome, together with the palace and the basilica built upon it. This *Lateran basilica*, originally called the Church of Christ the Saviour, has since the tenth century borne the name of St. John *Lateran*, from the adjoining monastery of St. John, and is the Pope's cathedral church, officially styled "mother and head of all churches of the City [Rome] and the world." It was consecrated in A. D. 324, and has been rebuilt several times, the present structure, which dates from the fourteenth century, having been modernized in the seventeenth. The *Lateran palace* was the residence of the popes for nearly a thousand years (till 1309), was afterward burned and rebuilt, and is now used as a museum, containing both classical and Christian antiquities. Adjoining the basilica is the ancient baptistery in which, according to tradition, Constantine was baptized.—*Lateran councils*, eleven councils held in the *Lateran basilica*, including an important synod convened against the Monothelites in 649, and five general councils of the Western Church (1123, 1129, 1179, 1215, and 1512-1517), regarded by Roman Catholics as oecumenical, the fourth being the most important.

laterite (lat'ē-rīt), *n.* [*L. later*, a brick, a tile, + *-ite*.] A rock of peculiar character, found in India and some parts of southwestern Asia.

Its essential features are that it is highly ferruginous and that it forms the superficial covering of the country. In its normal form it is a porous argillaceous rock, largely impregnated with the peroxid of iron, some kinds containing as much as 25 or 30 per cent of metallic iron. Although the laterite is in process of formation at the present time, some of it dates back to the Tertiary, and perhaps as far back as the Eocene. There are two rather distinct forms of this rock. One is extensively developed on the west coast of India, where it forms the surface-rock of the country over wide tracts of the low lands near the sea. This, which is called the *low-level laterite*, is clearly of detrital origin, and it rests indifferently on various older rocks. The iron it contains appears to be due to the fact that it is formed, in part at least, from the debris of the high-level laterite, and in part to the large quantity of iron ore present in the old volcanic rocks of the region. The origin of the *high-level laterite*, which is found extensively on the highlands of central and western India, is more difficult to explain. It appears, beyond doubt, to have resulted in considerable part from the decomposition in situ, by atmospheric agencies, of the volcanic rock which it overlies.

It consists of a watery fluid holding in solution small quantities of sugar, gum, alkaloid and acid matters, etc., and, suspended in this, numerous minute granules (giving the milky appearance) which coagulate when exposed to the air. A machine for working wood, metals, or other substances by causing the material to turn with greater or less speed, according to the nature of the material and the work to be performed, before a tool which is held at rest relatively to the peripheral motion of the object operated upon. Lathes are used for turning, cutting, chasing, filing, polishing, screw-cutting, engraving, and shaping, as in metal-spinning. They range in size from a jeweller's lathe for polishing the finest metal-work, through the various wood-turning lathes, to the large machine-lathes for turning locomotive-wheels, and the heavy machines for polishing stone and marble columns for architectural purposes. The ancient potter's wheel is probably the prototype of the modern lathe. The common wood-turning lathe may be taken as a type of these machines. It consists essentially of the bed or main horizontal frame, the poppet, and the rest or support of the tool used in operating the lathe. The poppet can be moved into different positions and clamped on the bed, and form at the left the live or moving head-stock, connected directly with the source of power, and at the right the dead or stationary head-stock, sometimes called *tail-stock*. The work or material is placed between these, and is supported by a live center in the live head-stock and a dead center in the dead head-stock; and in the ordinary lathe the cutting is performed concentrically with the axis joining these centers, the material being rotated by the live head-stock. By the adjustment of the poppet on the bed the lathe may be adapted to receive different lengths of material. Usually the dead head-stock only is moved toward or away from the live head-stock in making this adjustment. Facing the work, and clamped to the bed between the poppet, is the tool-rest, on which, in hand-turning, the tool rests as on a fulcrum at a point very near the work, being held in the working position by the hands of the turner, which grasp the outwardly projecting handle of the tool. Such a lathe is driven at high speed, and the amount and character of the turning are controlled by the workman who holds the tool on the tool-rest and before the work. The side-rest is a movable tool-rest carrying an adjustable tool-stock or tool-post in which the tool is rigidly clamped. It slides on longitudinal guideways formed on the bed of the lathe, this movement being controlled by a screw and sometimes being automatic. The tool-rest may be double, presenting two tools, one on each side of the work, as in the duplex lathe. The tool may also be controlled by a template or model, and shift its position automatically, as in the lathe for turning irregular forms, the milled-work lathe, spoke-lathe, and last-lathe, of which the Blanchard lathe is the original type. Iron-turning requires a much slower speed than brass-turning, and wood-turning a higher speed than brass. Large metal-lathes are said to be of large *swing*; that is, the space between the centers and the bed is great, to admit of turning large objects. In one form of these machine-lathes an opening is made in the bed to permit the work to turn or to give large swing, as in the gap-bed lathe. In many kinds of turning the dead head-stock is not used, the material to be turned being attached to a lathe-chuck, or to a face-plate carried by the live head-stock. Lathes are nearly all described by their names, as *bed-work-lathe*, *button-lathe*, *foot-lathe*, *spoke-lathe*, etc., the names sometimes referring to some feature of the construction, as the *hollow-mandrel lathe*, and sometimes to the material or work, as the *hat-forming lathe*.

Could turn his word, and oath, and faith,
As many ways as in a *lathe*.
S. Butler, Hudibras, III. ii. 576.

2. That part of a loom in which the reed is fixed, and by the movements of which the weft-threads are laid parallel to each other, shot after shot, in the process of weaving. According to the greater or less impulse of the lath, the weft is laid more or less closely together in the plane of the web. Also called *batten* and *lay*. — *Bed-work-lathe*, a lathe specially adapted or devoted to turning bed-work. — *Blanchard lathe*, a lathe in which the tool-position is shifted by a pattern or model to turn irregular forms. Gun-stocks, or yokes, wagon-wheel spokes, shoe-laths, certain styles of carvings, columns, etc., are made in lathes working on this principle, the lathes taking their special names from the kind of work they perform, as *spoke-lathe*, *last-lathe*, *gun-stock lathe*, etc. This lathe is named from its original inventor, Thomas Blanchard of Massachusetts (1788-1864), who patented it in 1819, and subsequently, with others, adapted it to a great variety of uses. — *Button-lathe*, a kind of chuck-lathe used in manufacturing buttons. — *Car-wheel lathe*, a double lathe for turning of the rims of locomotive driving-wheels or car-wheels. It is so arranged that two wheels fitted on one axle may be turned together, or, when desirable, two wheels may be turned independently, as each face-plate can be driven separately. — *Compound lathe*, a lathe for turning or engraving geometric forms; a geometric lathe or rose-engine. — *Copying lathe*, a form of lathe adapted for turning articles from a pattern on the principle of the Blanchard lathe. — *Cutting-off lathe*, a lathe for cutting rods, bars, and pipes to length. The object to be cut is passed through a collet at the rear end of the spindle, a concentric chuck holding it in front. — *Duplex lathe*, a lathe with two or more cutting-tools, so distributed

about the work as to balance the transverse pressure and avoid springing it. — *Eccentric lathe*, a lathe having a compound face-plate or sliding frame, and guides which present the object in such a way that the tool works an oval upon it. — *Gap-bed lathe*, a lathe having an opening in its bed to admit of turning objects of larger radius than would be possible with a continuous bed. Also called *gap-lathe*, *break-lathe*. — *Geometrical lathe*, an instrument used by bank-note engravers, watch-case manufacturers, etc., to make complicated patterns of fine lines. It forms the stars, rosettes, ornamental borders, etc., on plates for bank-notes, designed as a precaution against counterfeiting. Also called *rose-engine*. — *Gun-stock lathe*. See *Blanchard lathe*. — *Hat-forming lathe*, a lathe used for ironing hats. The hat-block is clamped in the lathe, and the heated iron is held against the nap while the block is turned. — *Hollow-mandrel lathe*, a lathe in which the mandrel of the live head-stock is hollow. It is much used for cutting screws upon, or for turning off the ends of long and slender rods, which are thrust through the hollow mandrel with the end of the rod which is to be turned projecting from the nose of the mandrel, and held in position for turning by universal chuck or other suitable holder. See *chuck* and *mandrel*. — *Parallel lathe*, a small hand-machine for jewellers', watchmakers',

or dentists' use. It is arranged to run simultaneously, if desired, several grinding-wheels of different sizes, a brush, a drill, etc. — *Roughing-lathe*, a lathe used by electrotypers as a substitute for a planer in "surfacing up" the backings of electrotypes preparatory to mounting them on wooden blocks. The plates are clamped upon a true face-plate attached to the mandrel of the lathe, with their printing-faces against the face-plate, and the backing-metal is turned off by a sharp cutting-tool controlled by a gage. The back surface is thus made parallel with the printing-surface, and the plate is reduced to the required thickness. — *Screw-cutting lathe*, a lathe especially planned for cutting screws. Some examples of this type of lathe are adapted also for boring cylinders, for turning shafting, and for miscellaneous work. Same as *screw-cutting machine*. See *screw*. — *Sphere-turning lathe*, a lathe adapted for turning objects to a true spherical shape. — *Wood-turning lathe*, a high-speed lathe the construction of which is specially adapted to wood-turning. It is the simplest form of lathe. The tools consist of a great variety of chisels and gouges of different widths, with long wooden handles, by which leverage is obtained upon the tool-rest as a fulcrum, for holding the tools firmly yet delicately with their cutting edges in proper relation with the material in the lathe. The same kind of lathe is also used for turning ivory, horn, bone, etc., the speed being regulated and the forms of the tools being varied to suit the nature of the materials. (See also *bench-lathe*, *carving-lathe*, *center-lathe*, *chuck-lathe*, *column-lathe*, *gap-lathe*.)

See *cross*. — **Latin empire**, the name given to the empire of Constantinople while under the rule of Latin (chiefly French) emperors, from 1204 to 1261. — **Latin kingdom**, the Christian kingdom of Jerusalem under the French or Latin kings, from 1099 to 1187, when the Christians were expelled, though the title "King of Jerusalem" was maintained long afterward. — **Latin league**, a confederation of the cities of Latium existing in Italy in the earliest historic times, and continuing till 338 B. C., when the Latin towns were finally incorporated in the dominion of Rome. According to the earliest tradition, the league included thirty cities, among which Alba Longa held the preeminent place. After the fall of Alba, Aricia, Lanuvium, and Tusculum, with other important communities not originally included, were united with the league. The confederation held assemblies in the grove of Ferentina, below Marino in the Alban hills, and had a common religious sanctuary in the temple of Jupiter Latialis on the summit of the Alban Mount (Monte Cavo), where annual sacrifices were celebrated. — **Latin Union**, a monetary alliance of France, Belgium, Italy, and Switzerland, formed by convention December 23d, 1865, and joined by Greece in 1868. Its object was the maintenance and regulation of a uni-

form interchangeable gold and silver coinage, based on the French franc. Its limited term was continued by two renewals (1875 and 1885), Belgium withdrawing on the latter occasion and adopting the single gold standard. — *Syn. See Roman*.

II. *n.* 1. A member of the race that inhabited ancient Latium in central Italy, including Rome; afterward, one to whom the Latin language was vernacular; an ancient Roman, Italian, etc. — 2. In modern application, a member of one of the races ethnically and linguistically related to the ancient Romans or Italians, by descent or intermixture: as, the *Latins* of Italy, France, Spain, and Portugal. — 3. The language of ancient Rome; the language originally spoken in Latium, and afterward extended over all the integral parts of the Roman empire in Europe, which is the basis of the modern Romance languages (see *Romance*), and has supplied the greater part in bulk of the vocabulary of modern English (see *English*). Latin belongs to the Italian branch of the Indo-European or Aryan family, together with Occitan, Umbrian, and other dialects of which hardly any remains are extant. Its nearer relations with the other branches of the family are matters of doubt and dispute. It was formerly, on insufficient grounds, believed especially akin with Greek; more recently, it has been thought closer to Celtic. Latin, with its literature, is divided chronologically into several periods. — In this dictionary, in the etymologies, into five, namely *Old Latin*, *Classical Latin*, *Late Latin*, *Middle Latin*, and *New Latin*. See below.

5. A member of a civil community in Turkey composed of such subjects of the Sultan as are of foreign ancestry and of the Roman Catholic faith. — 6. An exercise in schools, consisting in turning English into Latin.

By mine advice, he shall not use the common order in common schools, for making of *latines*.

Ascham, *The Scholemaster*, p. 25.

The divisions and periods of the Latin vary more or less with different writers. As generally adopted, and as somewhat more precisely discriminated in this dictionary and systematically followed in the etymologies, they are here defined in chronological order: **Old Latin**, Latin before the classical period, including *Plautus*, *Ennius*, *Terence*, *Cato*, and other early Latin authors (so far as they retain traces of the older language), and inscriptions of early date. — **Classical Latin**, the Latin of the writers commonly called classical (*Lucretius*, *Catullus*, *Cicero*, *Caesar*, *Sallust*, *Virgil*, *Nepos*, *Horace*, *Ovid*, *Livy*, *Tibullus*, *Propertius*, *Persius*, *Petroneus*, *Seneca*, the *Pliny*, *Statius*, *Tacitus*, *Juvenal*, *Suetonius*, etc.), from about 70 B. C. to about A. D. 275 or 300; the standard Latin of the grammars and dictionaries. — **Late Latin**, Latin immediately following the classical period, from about A. D. 275 or 300 to about 600, including the writings of *Aurelius*, *Claudian*, *Prudentius*, *Oronius*, *Cassiodorus*, *Boethius*, etc., and the early church fathers, *Tertullian*, *Lactantius*, *Jerome*, *Augustine*, etc. — **Middle Latin**, or **Medieval Latin**, the Latin of the middle ages, from about A. D. 600 to 1500. During this period the Latin vocabulary received enormous accessions from the Greek and Teutonic and Oriental tongues, as well as from the Romance tongues, the vernacular representatives of the ancient Latin, such accessions being fully accommodated to the Latin, or merely provided with Latin terminations, or received unchanged. Also called *Low Latin*, sometimes *Barbarous Latin*, especially with reference to its foreign elements. — **New Latin**, or **Modern Latin**, Latin as written in modern times, from about A. D. 1500 to the present time. It now includes especially the Latin used by scientific writers in description and classification. **New Latin**, like **Middle Latin**, possesses a huge literature, but the language in this form is now used almost exclusively in theological, philological, and scientific works. Its main use is to serve, with the Greek vocabulary, now in large part incorporated in **New Latin**, as the common vocabulary of civilization, the tendency being in each civilized tongue to form the terms required by the progress of science upon an actual or potential **New Latin** type.

Law Latin. See *law*. — **Low Latin**. See *Middle Latin*. — **Thieves' Latin**, thieves' language; thieves' cant or slang.

A very learned man, I promise you, and can vent Greek and Hebrew as fast as I can *Thieves' Latin*.

4. The elevation of the pole of the heavens at a station, or the angle at which the plane of the horizon is cut by the earth's axis; the total curvature or bending of a meridian between the equator and a station; the angle which the plumb-line at any place makes with the plumb-line at the equator in the same plane; on a map, the angular distance of a point on the earth's surface from the equator, measured on the meridian of the point: as, St. Paul's, London, is in lat. 51° 30' 48" N.; Cape Horn is in lat. 55° 59' S. *Latitude* is determined by different methods, according as circumstances may require. At sea the instrument exclusively used is the quadrant or sextant, the latter being simply a more accurately constructed and therefore more expensively form of the instrument. With the *latitude* of the sun is observed when the meridian, and from this altitude, with the aid of the declination taken from the Nautical Almanac, with certain corrections for dip, refraction, etc., the *latitude* is obtained. The same method is used on land (with the aid of an artificial horizon in place of the natural) in cases where no great accuracy is required, as in ordinary geographical reconnaissances. More accurate results are secured by increasing the number of observations by the method of circummeridian altitudes, several observations being taken just before and just after noon (or, if a fixed star is observed, before and after its culmination), from which, with suitable corrections, a mean result is obtained more accurate than that furnished by a single observation. A much higher degree of accuracy is reached by the use of the zenith-telescope, which is a portable instrument, but considerably less so than the sextant, which the observer holds in his hand. With this instrument the *latitude* is determined by measuring microscopically the difference of the meridional zenith-distances of two stars near the zenith, one north and the other south of it. The zenith-telescope is used for *latitude* determinations by the United States Coast and Geodetic Survey at the stations belonging to the primary triangulation. The most accurate method of determining the *latitude* in a fixed observatory is by observing, with the meridian circle, the altitude of a circumpolar star at its transits above and below the pole. This method is independent of the declination of the star, and not necessarily liable to great errors of refraction. Another method sometimes employed in fixed observatories is to observe the transit of a star with a transit-instrument in the prime vertical, the time of the transit being observed with the instrument pointing east, and again with the same instrument pointing west, whence the altitude of the pole may be deduced. There are other methods of determining the *latitude*, but they are much less important than those mentioned.

5. In *astron.*, the angular distance of a star north or south of the ecliptic, measured on that secondary to the ecliptic which passes through the body. Secondaries to the ecliptic are called *circles of celestial latitude*, and parallels to the ecliptic are called *parallels of celestial latitude*. *Latitude* is geocentric or heliocentric according as the earth or the sun is taken as the center from which the angle is measured.

6. The quantity of the interval between two latitudes, either in the geographical or the astronomical sense: as, to sail through 30° of *latitude*.

The zodiac in heaven is imagined to be a superface containing a *latitude* of 12 degrees.

Chaucer, Astrolabe, I, 21.

7. A place or region as marked by parallels of *latitude*: as, to fish in high *latitudes* (that is, in places where the *latitude* is a high number); the orange will not ripen in this *latitude* (that is, it will not do so in any place on the same parallel of *latitude* as the place spoken of); you are out of your *latitude* (that is, literally or figuratively, you have committed an error of navigation, so that the *latitude* you have assigned to the ship's place is not the true one).

Those *latitudes* and altitudes where no crops will grow.

It is equal to half the sum of the latitudes of the two places when they are on the same side of the equator; when they are on opposite sides, it is equal to half the difference of their latitudes.—*Middle-latitude sailing*, a combination of plane and parallel sailing, so named from the use of the middle latitude—that is, the latitude of the parallel which is equally distant from the parallel left and the one arrived at. See *sailing*.—*Parallel of latitude*. Same as *circle of latitude* (b).

Jeremy Collier, *Kindness*.

2. Characterized by latitude or independence of thought, or by forbearance from strict insistence upon the usual standards of belief or opinion; especially, not rigidly strict in religious principles or views; tolerant of free-thinking or heresy: as, *latitudinarian* opinions or doctrines. The word is generally used opprobriously. It is specifically applied in church history to certain Episcopal divines of the seventeenth century (see below), but in later time to all who regard specific creeds, methods of church government, and forms of worship with comparative indifference.

II. *n.* 1. In *Eng. church hist.*, one of a school of Episcopal divines who in the seventeenth century strove to unite the dissenters with the Episcopal Church by insisting only on those doctrines which were held in common by both, and who, while they maintained the wisdom of the episcopal form of government and ritual, denied their divine origin and authority.

They wished that things might have been carried with more moderation, and they continued to keep up a good correspondence with those who differed from them in opinion, and allowed a great freedom both in philosophy and in divinity; from whence they were called "men of latitude"; and upon this men of narrow thoughts fastened upon them the name of latitudinarians.

Sp. Burnet.

2. Hence, in later times, one who regards with comparative indifference specific creeds, methods of church government, and forms of public worship; generally used opprobriously.

occupying an extensive area in the region of the Upper Lakes, and previously called by him the *metamorphic series*, and by Foster and Whitney the *azois series*. These rocks, which unquestionably underlie, unconformably, the oldest known fossiliferous strata, are now (following the lead of J. D. Dana) more generally denominated *arkosean*; and the same is true in regard to rocks of similar lithological character and of supposed similar stratigraphical position, which occur in other parts of the world, and which have been more or less vaguely and indiscriminately called *Laurentian*. Those who hold that the absence of traces of organic life is a matter of fundamental importance, and that the unavailing search for fossils in those rocks during half a century is at least a strong indication that none will be found, and that this fact should be recognized in the nomenclature, still adhere to the name *azois*, in preference to *arkosean*.—**Laurentian Library**, a celebrated library at Florence, founded by Pope Clement VII. (1523-34) from previous collections of the Medici family, to which he belonged, and named in honor of Lorenzo dei Medici. It contains many rare books, but is famous chiefly for its large collection of early and valuable manuscripts. Also called the *Medicean* or the *Mediceo-Laurentian Library*.

It embraces 42 genera and about 900 species of trees or shrubs, found for the most part in the warmer regions of America, Asia, Australia, and the islands of the Pacific. It is divided by modern authors into four tribes, the *Persea*, *Litsea*, *Cassytha*, and *Hernandia*, the last two abnormal and consisting each of a single genus. The plants of this order have strong properties, usually aromatic or medicinal. To it belong, besides the laurel, the genera *Cinnamomum* (producing cinnamon and camphor) and *Sassafras*, as well as other plants of economic importance. Also *Laureae*.

Such leaves are found in the Tertiary of Italy, Java, and New Zealand, and in the Cretaceous of Kansas and the British Northwest Territories.

Laurus (lâ-rus), n. [NL. use of L. *laurus*, the laurel-tree, applied by Linnaeus to the genus:

see *laurel*.] A genus of apetalous trees, type of the natural order *Laurineae*, falling within the tribe *Litaeae*. It is characterized by polygamous flowers in clusters of four together in an involucre, a perianth of 4 segments, and usually 12 to 20 stamens. Only 2 species are known, one, *L. nobilis*, the true laurel, inhabiting the Mediterranean region, the other, *L. Canariensis*, confined to the Canary Islands. They are small trees having alternate, entire, evergreen leaves, with the flower-clusters borne in their axils. The fruit is an ovoid berry. (See *laurel*.) An immense number of fossil leaves agreeing in all essential respects with those of *Laurus* have been found, ranging from the Lower Cretaceous of the British Northwest Territory and the Middle Cretaceous of Kansas, Greenland, and Bohemia to the Pliocene and Quaternary of Europe, showing clearly that the plants of this genus and closely related types were much more abundant formerly than now. *L. Canariensis* is also thus proved to have existed on the continent of Europe in Pliocene time.

lava (lâ'vâ), n. [= D. G. Dan. Sw. *lava* = F. *lave* = Sp. Pg. *lava*, < It. *lava*, a stream, esp. of molten rock, < *lavare*, wash, < L. *lavare*, wash: see *lave*.] Molten rock which issues from a volcano during an eruption; the same when cooled and hardened. Lavas after hardening differ much in structure and texture. Some are entirely made up of an interlaced mass of crystals, others are entirely vitreous, as in the case of obsidian or volcanic glass. Others, again, have a partially glassy matrix, in which crystals are embedded—this last being the most common arrangement. Lavas also vary much in respect to compactness; some have an open cellular structure, while others are very compact. The specific gravity of lava varies in the different kinds from 2.87 to 3.22. The heavier or more basic kinds contain much magnetite or titaniferous iron, together with angles and olivine. These contain from 45 to 50 per cent. of silica, and to this class belong the basalts, dolerites, and nephelins and leucite lavas. The lighter or more acid varieties of lava contain from 60 to 80 per cent. or more of silica. In this class are included the trachytes and rhyolites, as well as most of the picrosthenes, obsidians, and pumices. There are also varieties intermediate between the acid and the basic, such as andesite and hornblende andesite. Many volcanoes—at least during certain stages of their existence—throw out fragmentary materials only, and these are sometimes ejected during the same period of activity in which molten lava is poured forth. Among these fragmentary materials, ash, sand, lapilli, and even large angular masses occur. Portions of the molten material within the pipe of the crater are sometimes hurled aloft, and fall in the form of bombs, or in rough irregular masses, like furnace-slugs. Some volcanoes consist entirely of these fragmentary materials; others are chiefly made up of lava which became consolidated after ejection; in many cases, however, the mass of the cone has been built up by alterations of fragmentary and fluid material, and the whole is frequently bound together by dikes and sheets of lava forced into cracks formed during the operation.—**Lava millstone**, a hard and coarse basaltic millstone, obtained from quarries near Andernach on the Rhine. *Simmonds*.—**Lava-ware**, a kind of coarse ware resembling lava, made from iron slag, cast into urns, tiles, table-tops, etc.

lavabo (lâ-vâ'bô), n. [*L. lavabo*, 1st pers. sing. fut. ind. of *lavare*, wash: see *lave*.] 1. *Ecceles*, in the Roman Catholic Church, and in many Anglican churches, the ritual act of washing the celebrant's hands after the offertory and before entering upon the more solemn part of the eucharistic service: so called from the priest's reciting at the time the last part of the 26th psalm, beginning with the sixth verse, "I will wash my hands in innocency," in Latin, "*Lavabo manus meas in innocentia*." In the Greek Church this takes place in the prothesis, before vesting.—2. In many monasteries of the middle ages, a large stone basin from which the water issued by a number of small orifices around the edge, for the convenient performance of ablutions before religious exercises or meals. The lavabo was usually placed in a room, itself called *lavabo*, adjoining the cloister, and sometimes, as at the Cistercian Abbey of Fontenay, was the occasion of noteworthy architectural disposition. Also known in medieval times as *lavatorium*. Hence—3. A convenience of similar object and arrangement in some modern schools or institutions: a lavatory.

(Tournefort, 1700), dedicated to the two *Lavaters*, physicians and naturalists of Zurich.] A genus of malvaceous plants of the tribe *Malveae*, subtribe *Eumalveae*. It is closely related to *Malva*, the true mallow, but differs from that genus in having from 6 to 9 bractlets under the flowers (these being united at the base), and in the projecting and dilated carpels. There are over 20 species, chiefly natives of the Mediterranean region and western Europe, but 2 occur on the Canary Islands, 1 in central Asia, and 1 in Australia. They are tomentose or hirsute herbs, shrubs, or small trees, with angled or lobed leaves, and variously colored flowers, either solitary in the axils or in terminal racemes. *L. arborea*, the best-known species, is the tree-mallow or sea-mallow of Europe, which grows wild on the rocky coasts from Spain to Scotland. In cultivation it attains a height of 8 or 10 feet. It has pale purple-red flowers in long racemes at the ends of the annually flowering branches. It contains an abundance of mucilaginous matter, and yields a poor fiber. In common with other soft-leaved malvaceous plants, it is sometimes called *velvetleaf*. Same as *lavy¹* (lā), *n.* [*< ME. lavo, laghe, lage, lake*, *< AS. lagu* (rare, the usual words being *lag, L. fus*, and *dōm, L. decretum, statutum*) = *OS. lag = Icel. lög* (for *lagu*), law (cf. *lag*, a stratum, order) = *Sw. lag* = Dan. lov, a law (cf. *L. lex* (*leg-*), a law, from the same ult. root); lit. 'that which lies' or is fixed or set (cf. *G. gesetz*, *AS. gesetnes*, a law, *dōm*, a law, doom, *Gr. βεβήκε*, law, *L.*

statutum, a statute, all of similar etymological import), *< lagan* (pret. *lag*), lie: see *lail*.] 1. A rule of action prescribed by authority, especially by a sovereign or by the state: as, the laws of Manu; a law of God.

We must define *Laws* to be Rules of Conduct which we are morally bound to obey, . . . or, more briefly, Commands imposed by Rightful Authority.

H. Sidgwick, Methods of Ethics, p. 269.

Our human laws are but the copies, more or less imperfect, of the eternal laws so far as we can read them, and either succeed and promote our welfare, or fail and bring confusion and disaster, according as the legislator's insight has detected the true principle, or has been distorted by ignorance or selfishness. *Proctor.*

Specifically—(a) Any written or positive rule, or collection of rules, prescribed under the authority of the state or nation, whether by the people in its constitution, as the organic law, or by the legislature in its statute law, or by the treaty-making power, or by municipalities in their ordinances or by-laws.

It is essential to the idea of a law that it be attended with a sanction; or, in other words, a penalty or punishment for disobedience. *A. Hamilton, Federalist, No. 18.*

(b) An act of the supreme legislative body of a state or nation, as distinguished from the constitution: as, the constitution, and the laws made in pursuance thereof. (c) In a more general sense, the profession or vocation of attorneys, counsellors, solicitors, conveyancers, etc.: as, to practise law. (d) Litigation: as, to go to law.

Dare any of you, having a matter against another, go to law before the unjust? *1 Cor. vi. 1.*

2. Collectively, a system or collection of such rules.

Specifically—(a) The principles and regulations of human government in their application to property and conduct; those general rules of external human action which are enforced by a sovereign political authority (*Holland*); the aggregate of rules set by men as politically superior or sovereign, to men as politically subject (*Austria*); rules of human conduct prescribed by established usage or custom, or by a constitution adopted by the people, or by statutes or ordinances prescribed by a legislative power, or by regulations of judicial procedure, or recognized and enforced by judicial decision. Modern difference of opinion as to the proper definition of law chiefly results from the fact that writers of the analytic school, proceeding by an analysis of the usual mental conception of law under monarchical government, have commonly defined it as in essence command by a superior to an inferior; and as perhaps the larger part of modern law—such, for instance, as the law of negotiable paper and of contracts generally—does not consist of commands or prohibitions, this definition is supported by the argument that what the sovereign permits he commands, or at least indirectly commands, shall not be prevented. Writers of the historical school, on the other hand, tracing government by law back to its early development, have defined law as essentially consisting of what is judicially ascertained to be usual and regular. In either view it is agreed that a true law in the sense of jurisprudence is one which deals with a class of things, acts or omissions, as distinguished from particular commands and awards. Law, as it actually exists in modern society, is the aggregate or system of rules by which a political community or congeries of communities regulates or professes to regulate the conduct and the rights and powers of its members and its own interference with their freedom; and any rule answering this description is, if authoritatively promulgated, a law. Every new judicial decision, also, is a part of the law in the sense that it actually regulates conduct, rights, or powers. (b) The system of law, often slightly personified: as, in the eye of the law; in the custody of the law; the law presumes or intends.

No man e'er felt the halter draw,
With good opinion of the law.
J. Trumbull, McFingal, III. 490.

(c) The mosaic system of rules and ordinances.

Think not that I am come to destroy the law, or the prophets: I am not come to destroy, but to fulfil.
Mat. v. 17.

Hence—(d) The books of the Bible containing this system; the books of the law.

After the reading of the law and the prophets, the rulers of the synagogue sent unto them. *Acts xiii. 15.*

(e) The preceptive part of the Bible, especially of the New Testament, in contradistinction to its promises.

And worch one Myracle, and preche and teache the Feythe and the Love of Cristene Men unto his Children.
Mandeville, Travels, p. 1.

Bear ye one another's burdens, and so fulfil the law of Christ.
Gal. vi. 2.

3. A proposition which expresses the constant or regular order of certain phenomena, or the constant mode of action of a force; a general formula or rule to which all things, or all things or phenomena within the limits of a certain class or group, conform, precisely and without exception; a rule to which events really tend to conform. A mere empirical formula which satisfies a series of observations sufficiently, but would not hold in extreme cases, is not considered as a law. A special fact is not a law; but a subordinate principle, as that planets revolve in ellipses, is or is not a law according to the shade of meaning with which that word is used.

I see another law in my members, warring against the law of my mind. *Rom. vii. 23.*

The laws of nature are the rules according to which effects are produced; but there must be a cause which operates according to these rules. The rules of navigation never steered a ship, nor the law of gravity never moved a planet. *Shak.*

Law means a rule which we have always found to hold good, and which we expect always will hold good.

Huxley, Lay Sermons, p. 340.

Thus the belief in an unchanging order—the belief in *law*, now spreading among the more cultivated throughout the civilized world, a belief of which the primitive man is absolutely incapable.

H. Spencer, Prin. of Psychol., § 484.

4. One of the rules or principles by which anything is regulated: as, the *laws* of the turf; the *laws* of versification. — 5. A rule according to which anything is produced: as, the mathematical *law* of a curve. — 6. An allowance in distance or time granted to an animal in a chase, or to a weaker competitor in a race or other contest; permission given to one competitor to start a certain distance ahead of, or a certain time before, another, in order to equalize the chances of winning.

These late years of our Civil Wars have been very destructive unto them; and no wonder if no *Law* hath been given to furies, when so little hath been offered toward men.

Fuller, Worthies, Cambridgeshire.

Her Grace saw from a turret "sixteen bucks, all having fayne *lawes*, pulled downe with greyhounds in a laund or lawn."

Strutt, Sports and Pastimes, p. 71.

Two well-known runners, chosen for the hares, started off. . . . Then the hounds clustered round Thorne, who explained shortly, "They're to have six minutes' *law*."

T. Hughes, Tom Brown at Rugby, l. 7.

7. Custom; manner. *Halliwel.* [Prov. Eng.]

—**Act and operation of law**, such a mode of the creation or transfer of rights as does not depend on the intention of the parties, but on rules of law, applied, it may be, irrespective of their intention. Thus, where an owner of land dies intestate, the title is cast upon the heir by *act and operation of law*; and where a man becomes bankrupt, his property may be divested by *act and operation of law*, as distinguished from a transfer by *devises or voluntary act*. — **Adjective law**, rules of procedure, as distinguished from *substantive law* (which see, below). — **Agrarian law**. See *agrarian*. — **Alien and sedition laws**. See *alien*. — **Avogadro's law**, in physics, the law that equal volumes of different gases, under like conditions of pressure and temperature, contain the same number of molecules. — **Bae's law**. [Named from Karl Ernst Bae, 1792–1876.] The doctrine that the evolution of an individual of a certain animal form is determined by two conditions: first, by a continuous perfecting of the animal body by means of an increasing histological and morphological differentiation, or an increasing number and diversity of tissues and organic forms; second (and at the same time), by the continual transition from a more general form of the type to one more specific. — **Bankrupt law, bankruptcy laws**. See *bankruptcy*. — **Bell's law**, the law that the anterior spinal nerve-roots are motor and the posterior sensory. — **Bode's law**, an empirical formula supposed to express approximately the distances of the planets from the sun in terms of the distance from the sun of the innermost two. The rule is that the distances of the third, fourth, fifth, etc., planets from the orbit of the first are respectively twice, four times, eight times, sixteen times, etc., that of the second planet. It holds very roughly for all the planets except Neptune, and for the satellites of Saturn and Uranus. — **Boyle's law**, in physics, the law that at any given temperature the volume of a given mass of gas varies inversely as the pressure which it bears. It was discovered by Robert Boyle, and published by him about 1682; but Edme Mariotte having published a book concerning it (about 1679), the law was for a long time called *Mariotte's law*. — **Brachon laws**. See *brachon*. — **Canon law**. See *canon*. — **Case law**, law established by judicial decision in particular cases, as distinguished from *statute law*. Thus, when the courts are applied to for redress under novel circumstances—as in certain instances of boycotting—for which no positive law exists, case law necessarily results whichever way the courts decide; for if they hold that the person aggrieved is entitled to injunction or damages, they establish the unlawfulness of the act complained of; and if they decide that the action cannot be maintained, because there is no positive law to sustain it, they establish the lawfulness of the act, and, as a consequence, the lawfulness of incidental agreements to combine or render services in the promotion of such an act. The great body of the common law has grown up thus as case law, constantly modified, however, by statutes, which in their turn commonly give rise to new developments of case law called forth by controversy as to the interpretation and application of the statutory provisions. — **Charles's law**, the law that equal increments of temperature add equal amounts to the product of the volume and pressure of a given mass of gas. It was discovered by the French physicist Jacques Alexandre César Charles (1746–1823), the inventor of the Charles or hydrogen balloon, but was formerly often attributed to Dalton and to Gay-Lussac.

Charles's law—that, if the temperature be varied while the pressure upon the gas remains the same, the gas increases by $\frac{1}{273}$ of its volume at zero centigrade for every degree of centigrade added to the temperature, or, which in combination with Boyle's law is the same thing, that if the density be constant, the pressure is directly proportional to the temperature measured from the point—273° centigrade, this point being called the zero of absolute temperature.

Encyc. Brit., XVI. 611.

Claudian law, in *Rom. Hist.*, a law passed under the tribune M. Claudius Albinus, 304 B. C., forbidding an advocate to receive compensation for the pleading of a case, and restricting (ii) considered or unwise gifts of any nature by requiring certain legal forms of gift to be observed in almost all cases. The law was confirmed by a senatus consultum under Augustus, and so modified under Claudius as to permit a restricted compensation to lawyers. — **Civil, commercial, common, consuetudinary, criminal law**. See the adjectives. — **Conclusion of law**. See *conclusion*. — **Conflict of laws**. See *conflict*. — **Crown's quest law**. See *quest*. — **Crown law**. See

crown, a. — **Customary law**. Same as *consuetudinary law*. — **Dalton's law**, a law enunciated by John Dalton, that in a mixture of gases which do not enter into chemical reaction, but are in equilibrium, the total pressure is the same as the sum of the pressures which would be exerted by each constituent if the others were not present. The ordinary statement that each portion of gas behaves as a vacuum to all the rest is in a sense true, but tends to convey a wrong idea. — **Due process of law**. See *dual*. — **Dulong and Petit's law**, in physics, the law that the product of the specific heat of any element in the solid state multiplied by its atomic weight is (approximately) constant; or, in other words, that the different elementary substances have (nearly) the same atomic heat. — **Eccelesiastical law**. See *ecclesiastical*. — **Eight-hour law**. See *hour*. — **Empirical law**. See *empirical*. — **Enforcement law**, a United States statute of 1870 (16 Stat., 140) for enforcing the right of citizens to vote, and punishing offenses against the equal enjoyment of suffrage. It was specially directed to the protection of emancipated slaves recently admitted to citizenship. — **Exemptive law**. See *exemptive*. — **Ex post facto law**. See *ex post facto*. — **Falk laws**. Same as *May laws*. — **Faraday's laws**, in elect., certain principles established by Faraday governing the electrolysis of compounds. The most important are: (1) that the quantity of an electrolyte decomposed in a given time is proportional to the strength of the current; (2) that the weights of the elements separated are proportional to their chemical equivalents; and (3) that the strength of the electrolytic action is the same for cells in any part of the same circuit. — **Fechner's psychophysical law**, the law that as the physical force of excitation of a nerve increases geometrically the sensation increases arithmetically, so that the sensation is proportional to the logarithm of the excitation. Thus, if with a given degree of attention we just perceive the difference between the sensations of pressure produced by 1 pound and 1.1 pounds, we shall also just perceive the difference produced by 2 pounds and 2.2 pounds. The difference of sensation are thus the same in the two cases, and so are the differences of the logarithms of the pressures. According to Fechner, the total sensation varies directly with the logarithm of the stimulus divided by the stimulus just sufficient to give an appreciable sensation, or $s = k \log \frac{S}{S_0}$. This is *Fechner's formula*. — **Federal law**, that law which is prescribed by the supreme power in the United States, and regulates the organization of the federal government and its intercourse with the people, and that of the people with each other in matters of a national character, or with citizens of foreign states, as distinguished from *state law*, or that which is prescribed by the supreme power in any individual state, and regulates, in all matters not of a national character, the intercourse of such state with its own people, and that of its people among themselves. — **Robinson**. — **Forest law**, formal law. — **Galilean law**. See the adjectives. — **Four years' limitation law**. See *limitation*. — **Fugitive slave law**. See *fugitive*. — **Gay-Lussac's law**. Same as *Charles's law*. — **General law**, law not local, nor confined in application to particular persons; a statute so expressed as to be capable of application throughout the jurisdiction of the legislator. Some controversy has existed as to whether the test is in the form of the law or in the existence of the subject to which it applies; but it is now generally held that a law which in terms purports to apply to all persons or places of a specified class throughout the state is a general law, although at the time when it is passed there may be only one such person or one such place in the state. — **Gibbet law**. See *Halifax law*. — **Gothland sea law**. See *law of the Wistyr*. — **Greenham's law**, in *polit. econ.*, the tendency of the inferior of two forms or classes of currency in circulation together to circulate more freely than the superior; a law shortly stated in the maxim that "bad money drives out good." It results from the disposition of those who hold gold to get rid of the inferior by passing it, and to hoard the superior, or, if coin, to select it for exportation. The law was named from a former master of the English mint, who observed and commented on it. — **Grimm's law**, in *philol.*, a law announced by Jacob Grimm, a great German philologist, though previously stated in part by Erasmus Luth, a Danish philologist, formulating certain changes or differences which the mute consonants undergo or exhibit in corresponding words in the Germanic or Teutonic branches of the Aryan family of languages. According to this law, stated briefly, the labials p, b, f in Greek, Latin, or Sanskrit become k, g, g in Gothic (with which English and the other Low German languages agree), and t (v), f, p in Old High German; the dentals d, t, th in Greek, etc., become th, t, d in Gothic; and g, z, t in Old High German; and the gutturals k, g, g in Greek, etc., become a (not quite regularly), t, g in Gothic, and g, ch, k in Old High German. But the Old High German shifting (which is a second and much later shifting, beginning about A. D. 600, from the completed Low German shifting) is incomplete and not wholly regular; it is best exhibited among the dental mutes. The following table shows the changes and the usual correspondences: (1) Aryan (Sanskrit, Greek, Latin, etc.). (2) Low German (Gothic, Scandinavian, Anglo-Saxon, English, etc.). (3) High German (Old High German, Middle High German, New High German).

(1) p b (ph, bh) t d th(dh) k g ch(kh, gh)
(2) (b) p b (b) th t d h k g
(3) (b) f p d s(t) t g(h) ch k(g)

For example, *Goth. pitar* (pitar) = Gr. *pater* = L. *pater* = Goth. *fadar* = OHG. *fater* = E. *father*; *Mkt. tram* = Gr. *trō* = L. *trō* = Goth. *thru* = OHG. *tru* = E. *thru*; *Goth. fānu* (for *gānu*) = Gr. *gēvō* = L. *genū* = Goth. *knū* = OHG. *chūn*, *chūn* = E. *know*. In the application of Grimm's law numerous inconsistencies and anomalies appear, due to interference, conformation, particular position or sequence of sounds, variations of accent, and other causes explained by other philological laws, or remaining in small part occult. The most important of these other laws is Verner's law (which see, below). See also the articles on the separate letters. — **Haacke's law**, a concise statement of the fact that every individual organism, in its development from the ovum (or its ontogeny), goes through a series of evolutionary stages in each of which it represents a stage of the evolution of the class to which it belongs (the evolution of the class being phylogeny); and that every such organism

"breeds true" (or shows palingeny) in so far as it is influenced by heredity, and becomes modified (or shows kenogeny) in so far as it is influenced by conditions of environment. See *homogeny*, *ontogeny*, *palingeny*, and *phylogeny*. — **Halifax law** or *inquest*, a hasty trial followed by immediate punishment; an irrevocable punishment inflicted upon a summary trial without adequate opportunity of defense, so that subsequent proof of innocence becomes unavailing. The phrase originated from the so-called *gibbet law* or custom in the forest of Hardwick, coextensive with the parish of Halifax, England, under which the fifth burghers summarily tried any one charged with stealing goods to the value of 13s. 4d., and could condemn him to be beheaded on the market-day. — **Health laws**. See *health*. — **Heir at law**. See *heir*. — **Higher law**, a law paramount to human law or statute. This phrase was used by William H. Seward in a speech in the United States Senate, March 11th, 1850, on the admission of California as a State, and became celebrated in connection with the slavery question, as intimating that, if the Constitution and laws did not condemn it, the law of a common humanity and justice should be appealed to. — **Homestead law**. See *case law*, above. — **Jurin's law**, in physics, the law that the ascent of a given liquid in a capillary tube is inversely proportional to its diameter. — **Kepler's laws**, three laws of planetary motion, discovered by Johann Kepler (1571–1630), who announced the first two in his "De Motibus Stellæ Martis," in 1609, and discovered the third on March 6th, 1618. The three laws are as follows: (1) The orbits of the planets are ellipses having the sun at one focus. (2) The areas described by their radii vectores in equal times are equal. (3) The squares of their periodic times are proportional to the cubes of their mean distances from the sun. — **Kirchhoff's laws**, in elect., two laws stated as follows: (a) At any junction-point in a network of conductors the sum of all the currents which flow toward the junction is equal to the sum of all the currents which flow away from the junction (called the *condition of continuity*). (b) In any complete electric circuit the sum of the electromotive forces, reckoned in order round the circuit, is equal to the sum of the products of the current through and the resistance of each conductor forming the circuit. — **Kopp's law of boiling-points**. See *boiling-point*. — **Law French**, the form of Old French (Norman French) used in all common-law proceedings from the time of William the Conqueror to that of Edward III., and to some extent long afterward in certain formal state proceedings. — **Law language**, the technical phraseology used in legal writings and forms. — **Law Latin**, Latin as used in law and in legal documents. It is a mixture of Latin with Old French and English words adapted to Latin inflections. — **Law merchant**, commercial law; the body of principles and rules, drawn chiefly from the customs of merchants, by which the rights and obligations arising in commercial transactions are determined. — **Law of absorption of light**, the law that the proportion of homogeneous light transmitted varies geometrically as the thickness of the absorbing medium varies arithmetically. — **Law of action and reaction**, law of causation, law of citations, law of color. See *evidence*, *facility*, *heterogeneity*, *homogeneity*, *integrity*, *mortality*, *nature*. — **Law of independence**. See *independence*. — **Law of motion**, under *motion*. — **Law of nations**, international law. The phrase *law of nations*, originally adopted to designate those ethical principles of law deemed obligatory on all nations as the law of a particular nation is conceived as applicable to all persons within that nation, has been superseded by the more appropriate term *international law* (which see, under *international*), which includes the results of conventions and treaties. — **Law of paramountcy**, the logical principle that we ought not to suppose the existence of anything not necessary to account for admitted facts. — **Law of perseverance**. See *law of motion*, under *motion*. — **Law of reciprocity of prime numbers**, the proposition that if p and q are two prime numbers, then, if p is a quadratic residue of q, q is also a quadratic residue of p, unless both leave the remainder 3 when divided by 4, when, if p is a quadratic residue of q, then q is not a quadratic residue of p. — **Law of the unity of ideas**. See *forum*. — **Law of the land**. (a) In constitutional provisions securing its protection to persons and property, due process of law.****

By the *law of the land* is more clearly intended the general law which hears before it condemns; which proceeds upon inquiry, and renders judgment only after trial. The meaning is that any citizen shall hold his life, liberty, property, and immunities under the protection of general rules which govern society. *D. Webster.*

(b) The established law of a country.

As soon as a nation has assumed the obligations of international law, they become a portion of the *law of the land* to govern the decisions of courts, the conduct of the rulers, and that of the people.

See *honor*. — **Laws of Manu**, a Hindu code or compilation, partly of the laws administered in Hindustan, and partly of that which in the opinion of Brahmins ought to be the law. — **Laws of motion**. See *motion*. — **Laws of Oléron**, the oldest collection of modern maritime laws, said to be a code existing at Oléron, an island off the coast of France, about the middle of the twelfth century, which was compiled and put on record

by Eleanor, Duchess of Guenne, mother of Richard I. of England, and introduced into England with some additions in the reign of Richard I. (1189-99).—**Laws of the Deemvire.** See *Twelve Tables*, under *table*.—**Laws of the Henne towns.** See *Henne*.—**Laws of thermodynamics.** See *thermodynamics*.—**Laws of Wisby** (or Wisby), a code or compilation of maritime customs and adjudications adopted in the island of Gotland in the Baltic sea, of which Wisby was the principal seaport. By the law-writers of the northern European nations it has been claimed that these laws were older than the laws of Oléron, but the better opinion seems to be that they were later, and in some respects an improvement. The code was not established by legislative authority, but its provisions attained the sanction of general use and observance among the mariners of northern Europe. Sometimes called the *Gotland sea laws*.—**Lea's law**, a law discovered by H. Y. K. Lea, according to which the currents induced in an electric circuit, by changes of the current in, or of the position of, an adjacent circuit through which a current is flowing, are always in such a direction as by their action on the inducing circuit to oppose the change.—**Levitical law.** See *Levitical*.—**Liard law**, a punishment without trial. Compare *Halfway law*.—**Local law.** See *statute*.—**Lynch law.** See *lynch-law*.—**Maine law**, a prohibitory liquor law passed by the legislature of Maine in 1851, and permanently established in 1853.—**Mallie in law.** See *malice*.—**Marlotte's law.** See *Boyle's law*.—**Maritime, martial, mercantile, military, etc., law.** See the adjectives.—**Matter of law.** See *matter*.—**May laws**, several Prussian statutes (1773-4), also called the *Pöhl laws* from the name of the introducer, restricting the action of the church, by forbidding it to impose civil penalties or pronounce against person, property, freedom, or good name of the citizen, or use its discipline against the law of the land, by extending state surveillance over monastic colleges, seminaries, etc., and removing hindrances to secessions from any church. They were considerably modified in 1807.—**Marsenne's laws.** [Named from their discoverer, Marin Marsenne (1588-1643), a Franciscan monk.] Three laws showing the dependence of the time of vibration of a string upon its length, tension, and density; namely, that the time varies directly as the length and as the square root of the density, and inversely as the square root of the tension.—**Mixed laws.**—**Mosaic law, municipal law, natural law, naval law.** See the adjectives.—**Moral law**, that portion of Old Testament law which relates to moral principles, especially the ten commandments.—**Myrmidons of the law.** See *myrmidon*.—**Newton's law of cooling**, the law that the quantity of heat lost by a body by radiation in a given time is proportional to the difference between its temperature and that of the surrounding medium. It holds very nearly true within certain narrow limits.—**Normative law**, a rule to which any process must conform in order to attain its end.—**Ohm's law**, in *elect.*, an important law propounded by G. S. Ohm, giving an expression for the strength of an electric current, or the quantity of electricity passing in a given time, under certain conditions. It may be expressed as follows: the strength of an electric current, or the quantity of electricity passing a section of the conductor in a unit of time, is directly proportional to the whole electromotive force in operation, and inversely proportional to the sum of all the resistances in the circuit.—**Organic law.** See *organia*.—**Periodic law**, in *chem.* See *periodia*.—**Policy of the law**, the general purpose and spirit of the law: a phrase used to designate certain prohibitions applied by the courts, without positive statute enactment. Thus, a contract to combine in bidding at a judicial sale, so as to diminish competition, is held void as against the *policy of the law*, or as against public policy.—**Political law.** See *political*.—**Poor law**, poor laws, laws providing for the support of paupers at public expense. The general policy of such laws in England and the United States has been to provide for the local care of such persons as are unable to support themselves and have no relatives bound to support them, under the supervision of local officers in each parish, town, or county, with restrictions intended to prevent vagrancy and imposture, and to forbid the removal of the burden of support of any pauper from the town where he properly belongs to some other not properly responsible for him. The act which is regarded as the foundation of the system was passed in 1601 (43 Eliz. c. 2).—**Positive law**, law ordained by legislative power; human law; law which owes its force to human sanctions, as distinguished from divine law.—**Presumption of law.** See *presumption*.—**Private law.** See *private*.—**Raines law**, a law (named from Senator John Raines, its chief promoter), enacted in 1890 and amended in 1897, governing the sale and taxation of liquors in the State of New York. S. Hist.*, a law for the relief of debtors.—**Revenue law.** (a) A law which provides for the assessment and collection of a tax to defray the expenses of the government. *Cooley*. See *laws of Oléron* and *laws of Wisby*, above.—**Special law.** See *general law*, above, and *statute*.—**State law.** See *federal law*.—**Statute law.** See *statute*.—**Substantive law**, the rules of right which courts are called on to administer, as distinguished from rules of procedure or administration, called *adjective law*.—**Sumptuary law**, a law made to restrain excess in apparel, food, or any luxuries. Laws having only this object are now generally deemed objectionable as beyond the true province of civil legislation. The opponents of statutes in restraint of the liquor-traffic frequently stigmatize such statutes as "sumptuary laws." On the other hand, they are defended as a proper exercise of the police power of the state for the preservation of order and prevention of crime.—**Ten-hour law.** See *hour*.—**Theological ceremonial law**, that portion of the Old Testament law which relates to the Jewish rites and ceremonies.—**To have the law of or on**, to enforce the law against; go to law against. To lay down the law. See *down*.—**Town-bonding laws.** See *bond*.—**Verner's law**, in *philol.*, a law announced by Karl Verner of Copenhagen, in 1875, stating the effect of the position of accent in the shifting of the original Aryan mute consonants, and a into Low German, and explaining the most important anomalies in the application of Grimm's law (see *Grimm's law*, above). Verner's law is in substance as follows: If the Aryan *p*, *t*, or *k*, or *s* immediately follows the position of the accent, it shifts regularly to the Low German *f*, *th*, or *h*, as stated in Grimm's law; but if it precedes the position of the accent, it becomes sonant—that is, *p*, *t*, *k*, change to *b*, *d*, *g*, *z*. The law explains the apparent irregularity of Goth. *fadar* = A.S. *fader* = L. *pater* = Gr. *pater* = Skt. *pitar*, etc., with the accent originally on the last syllable, and the Aryan *t* accordingly changed to Low German *d* by Verner's law, instead of Low German *th*, as Grimm's law would require, as against Goth. *bróðer* = A.S. *broðer* = Latin *frater* = Gr. *phrater* = Skt. *bhrātar*, with the accent originally on the first syllable, and the changes regular according to Grimm's law. It also explains the change of original *s* to *z*, from which, in Anglo-Saxon, etc., was developed *r* (as in *case, form, etc.*). See *rhodolaim*.—**Wager of law.** See *wager*.—**Weber's law**, in *psychophysics*, the statement that the variation of the stimulus which produces the least appreciable variation in the sensation maintains a fixed ratio to the total stimulus. It is only approximately accurate.—**Written law**, statute law, as distinguished from the common law, or law resting in usage, custom, and the decisions of the courts. (As to noted laws on particular subjects, such as *naturalization laws*, *presumption laws*, *reconstruction laws*, see the words characterizing the laws. See also *act*, *article*, *bill*, *by-law*, *charter*, *code*, *decrees*, *edict*, *ordinances*, *petition*, *provision*, *statute*.)—**Wyn. Right, Equity, etc. (see justice): Law, Common Law, Statute, Enactment, Edict, Decree, Ordinance, Regulation, Canon.** Law is the generic word, covering not only what is commanded by competent authority, but modes of action and orders of sequence: as, the *Salic law*; a law of rhetoric or logic; a law of nature; a law of character. *Common law* is that rule of action which has grown up from old usage and the decisions of judges. *Statutes and enactments* are laws made by legislative bodies; the slight difference between them is implied in their derivations. *Edicts and decrees*, on the other hand, are not legislative, but personal or executive acts, an edict being generally the command of a sovereign, and especially of an autocrat, while a decree is generally the order of an executive body or a court. *Ordinance* is very broad in its use, being applied to *statutes* (especially those of great importance: as, the *ordinances of 1787*), to *decrees*, to the local laws passed by city governments, etc. A *regulation* is a limited, subordinate, or temporary law or rule, perhaps applying to details of management or behavior, and often without expressed penalty for violation: as, *army regulations*; the *regulations* in a constitution. *Canon* is in this connection strictly an ecclesiastical term.

Allowable, permissible, regular.—1 and 2. *Lawful, Legal, Legitimate, Licit*, legalised, authorized, constitutional, just. Between *lawful* and *legal* there is really the same difference in breadth that there is between *law* and *legislation* or *statute*. (See *law¹*.) *Legal* is exact, meaning conformed to the law of the land, and having little figurative use: as, *legal interest*; a *legal act*. *Lawful* means not opposed to law, primarily to the law of the land, but with a good deal of freedom in figurative extension: it is unlike *law*, however, in always seeming figurative when carried beyond its primary meaning. *Legitimate* has as one of its primary meanings the idea of being born under law: as, a *legitimate child*; its other meanings are kindred. A *legitimate* inference is one that is drawn in conformity with the laws of truth or thought. That which is *legitimate* is generally something made or done in conformity to law, principle, justice, fairness, or propriety. *Licit* is rarely used except in the phrase *licit or illicit*; these words apply to that which is lawful or unlawful, or perhaps only legal or illegal, in trade, relations, or especially intercourse, *licit* expressing much more opposition than *unlawful* or *illegal*. See *criminal*.

lawn² (lân), *n.* and *a.* [Early mod. E. also *lawne*, *lawne*, < *ME. lawnde, lawnde*; origin uncertain; by some regarded as a peculiar use of *lawn¹*, either "because from its fineness it was bleached on a lawn or smooth grassy sward" (Imp. Dict.) (whereas the word existed in the form *lawnd*, *lawnd*, at a time when the other word *lawn*, earlier *lawnd*, *lawnd*, had not the sense of "a bleaching-lawn"), or because, as "a transparent covering," it might be derived from the sense of "a vista through trees" (Wedgwood). The probable source is that pointed out by Skeat, namely, F. *Laon* (formerly also *Lan*), a town near Rheims. *Lawn* was formerly also called "cloth of Rheims," and Rheims is not far from *Cambray* and *Tournay*, which have given *cambric* and *dornick* respectively (Skeat). For the form, cf. *fawn*, < F. *faon*.] 1. *n.* 1. Fine linen cambric, used for various purposes: also applied in the trade to various sheer muslins. *Lawn* is notably used for the sleeves and other parts of the dress of bishops of the Anglican Church. The word is hence much used in allusion to bishops, like *ermine* in allusion to judges.

And ther typon a shete of *lawnde* was spredde,

And stood up in their sarks of *lawn*.

Duel of Wharton and Stuart (Child's Ballads, VIII. 285).

lawn-mower (lân'mô'ër), *n.* One who or that which mows a lawn; specifically, a machine, either pushed over the ground by hand or drawn by a horse, according to its size, for cutting the grass on a lawn. The lawn-mower consists essentially of a double-edged spiral knife, or a series of spiral knives, set in the periphery of a cylinder, which is caused by gearing to rotate in contact with the edge of a stationary rectangular knife placed tangentially to the cylinder at the height from the ground at which the grass is to be cut. The knives thus clip off the grass upon the principle of scissors.

lawn-sprinkler (lân'springk'lër), *n.* A contrivance for irrigating a lawn or garden gently and evenly. A common form consists of a vertical pipe supported on a stand, and having an attachment for a hose at the lower end and a swivel collar at the upper end. From the swivel collar project one or more short branches with small perforations, and all turned laterally in the same direction with reference to the center. When the water is turned on, its escape from these holes causes the swivel collar to revolve rapidly, and the water is by centrifugal force spread in fine drops over a circle of moderate diameter.

lawn-tennis (lân'ten'is), *n.* A game played with a ball and rackets on a lawn or other smooth surface by two, three, or four persons. A space, 78 by 27 feet if two play, 78 by 36 if three or four play (called a court), is laid off, and is divided lengthwise into two equal parts by the line *L F*, and crosswise by a net, *C I*, 3 feet high in the middle, and 3 feet 6 inches

at the ends *C* and *I*; service-lines *B J* and *D H* are also drawn on each side 21 feet from the net. A player standing on the base-line *L F* must serve (that is, knock) the ball with his racket over the net into that part of the court lettered *C N O D*, and his opponent must return the ball on the first bound into any part of the court on the side of the net opposite to him; the original player or his partner must return the ball again, striking it on the fly or the first bound; and thus the ball is driven back and forth over the net until one side fails to return it or knocks it out of the opponent's court. Failure to serve the ball (known as a *fault*), on two trials, into the proper part of the court, or failure to return a ball at any time during play, counts 15 for the opposing side, a second such failure makes the opposing score 30, a third 40, and a fourth game. Should both sides, however, attain a score of 40, such a situation in the game being known as *deuce*, one side to win must secure two points in succession: or, if one side has an *advantage* or *pace*—that is, the first point gained after *deuce*—the other side must make three points in succession in order to win.

Lawn-tennis is a modern adaptation of the first principle of tennis, in the simplest form, to a ball-game played on grass with rackets. *Encyc. Brit.*, XXXII. 181.

*lead*² (led), n. and a. [*ME.* *lead*, < *AS.* *lêd*, *lead*, = *OFries.* *lêd* = *D.* *lôd*, *lead*, = *MLG.* *lôt*, *lead*, a weight, *lode*, a plummet, = *MHG.* *lôh*, G. *loth* = *Sw.* *Dan.* *lod*, a plummet, a lead, ball, bullet, a weight. The word occurs disguised in *pilot*, q. v. Another Teut. word for 'lead,' the metal, is OHG. *blîo*, MHG. *blî*, G. *blei*, MLG. *blî*, *blîg* = *Icel.* *blîg* = *Sw.* *Dan.* *blî*; the L. is *plumbum* (see *plumb*).] 1. n. 1. Chemical symbol, Pb; atomic weight, 206.92. One of the useful metals, remarkable for its softness and durability. It belongs to the class of white metals, but has a decided bluish-gray tint, expressed by the common term 'lead-gray.' The freshly cut surface is lustrous, but it soon becomes dull from the formation of a film of oxid. Lead is the softest metal in general use; it can be scratched by the finger-nail, and is easily cut with a knife. It is very malleable, and can be rolled into thin sheets; but it cannot be drawn into fine wire. Lead rarely occurs in the native form; as a general rule, and possibly in every instance, the particles of the metal thus found are associated with some ore of lead, or occur in such a manner as to indicate that they are of secondary origin. The most important localities of native lead are in Sweden, near Fajaberg, where this metal occurs in small siliceous masses and scaly grains, associated with magnetite in dolomite, and also near Nordmark, where pieces several ounces in weight have been obtained. Native lead has also recently been found crystallized in various forms belonging to the isometric system. Its specific gravity is about 11.4. It fuses at about 617°; when heated before the blowpipe on charcoal, it is volatilized, leaving a yellow incrustation. The ores of lead are numerous and widely distributed, occurring in many countries in very considerable quantity. The most important of these ores is the sulphuret (galena), which contains 86½ per cent. of the metal. This ore is found in greater or less quantity in a very large number of metalliferous veins, especially such as produce gold and silver. Galena almost always contains at least a trace of silver, and in most regions the quantity of the precious metal is sufficient to make its separation profitable. (See *Parkinson process* and *Parkes process*, under *process*.) The carbonate of lead (cerussite) is also an important ore of this metal, and so is the sulphate (anglesite), but in less degree. These ores also usually contain silver in paying quantity, and the value of the precious metal is frequently greater than that of the lead itself. One of the chief uses of lead is for service-pipes in the supply of houses with water, a purpose for which the ductility and flexibility of this metal admirably adapt it. A serious drawback, however, is its liability to oxidation and the poisonous nature of the resulting combination, and to overcome this tendency lead pipes are often lined with tin. Another important use of lead is as the base of oil-painting, for which purpose it is used in the form of the carbonate. (See *white lead*, below.) Lead is also much used in the form of shot and bullets. The most important alloy of which lead forms a part is pewter.

2. A plummet or mass of lead attached to a graduated line, used in sounding at sea. It is usually in the shape of the frustum of a cone or pyramid. For depths of 30 fathoms or under, it has a weight of from 5 to 9 pounds, and is called a *hand-lead*. For depths from 30 to 60 fathoms, the lead weighs from 30 to 60 pounds, and is called a *casting-lead*. For depths from 60 to 200 fathoms, a *deep-sea lead* is used, weighing from 75 to 120 pounds. A special apparatus, called a *deep-sea sounding-machine*, is used for depths above 200 fathoms. See *deep-sea sounding-machine*, under *deep-sea*.

3. In *printing*, a thin strip of type-metal (sometimes of brass), used to increase the space between lines of composed types. Leads are usually

cast to fractional parts of the body piece. The thickness most used is six-to-pica, one thirty-sixth of an inch, but there are many sizes both above and below this. To make matter still more conspicuous, double leads (two leads together) are often used, and sometimes treble leads.

There is a newspaper in another city which . . . avoids double leads, capitals, pictures, and all forms of typographical hysteria. *Harper's Mag.*, LXXVIII. 618.

4. A small stick of black-lead or plumbago used in pencils.—5. *pl.* Sheets or plates of lead used for covering roofs: sometimes used as a singular for a flat roof covered with lead.

Same as *sheet lead* (which see, below).—*Mopk lead*. Same as *blende*.—*Red lead*, a pigment formed by the exposure of litharge to the action of air at a temperature of 500°, under which conditions it absorbs oxygen. It is used for a variety of purposes. When mixed with mastic and linseed-oil, it is used as a cement for the flanges of steam-pipes, but it enters the market chiefly as a pigment, as when mixed with either water or linseed-oil, it covers extremely well.—*Red lead ore*. Same as *crocoite*.—*Sheet-lead*, a thin plate of lead made by passing a flat ingot repeatedly through a rolling-mill until the requisite thinness has been attained. Called in England *milled lead*.—*Sugar of lead*, or *lead acetate*, a crystalline salt prepared by dissolving lead or litharge in vinegar or pyro-ligneous acid. It has a sweetish taste, and in large doses is a violent irritant poison. It is used in medicine both internally and externally, and extensively in the arts.—To *arm a lead*. See *arm*.—To *heave* or *cast* the *lead*, to cast the deep-sea lead or hand-lead for the purpose of taking soundings.

York Plays, p. 51.

White lead, a mixture of the carbonate and the hydrated oxid of lead in somewhat varying proportions, approximating to 75 per cent. of the former and 25 per cent. of the latter. It is prepared as follows: Metallic lead is cast into perforated disks 7 inches in diameter and ½ inch thick, technically called *bookies*. These are packed into earthenware pots 15 inches high, and to each pot is added a small amount of acetic acid. The pots are then piled into bins 40 feet square, and the whole covered with spent tan-bark and left alone for nearly three months. During this time the temperature rises, steam is given off, and a rather complex chemical decomposition takes place, by which the metallic lead bookies become converted into the white carbonate. But the quantity of lead converted into white lead seldom amounts to more than 65 per cent. The bins are unloaded and the contents of the pots thrown into a revolving screen, which separates the white lead from the unconverted metallic lead, this latter being remelted and put through the process again. The white lead is ground to a fine powder, and then made into a paste with 10 per cent. of linseed-oil, forming the paint known as white lead in oil. This method of converting metallic lead into white lead is known as the "Dutch process." Other methods tending toward greater quickness and economy have also been used.—*Yellow lead ore*. See *wulfenite*.

The league developed great strength, and became the chief factor in the political movement for home rule in Ireland, also led by Mr. Parnell.—*Latin League*. See *Latin*.—*Primrose League*, in Great Britain, a league or combination of persons pledged to principles of conservatism as represented by Benjamin Disraeli, Earl of Beaconsfield (1804–81), and opposed to the revolutionary tendencies of Radicalism. The object of the league is declared to be "the maintenance of religion, the constitution of the realm, and of the imperial ascendancy of Great Britain." The scheme of the organization was first discussed at the Carlton Club, in October, 1883, and the actual league made its first public appearance in a grand banquet at Freemasons' Tavern in London a few weeks later. The organization of the league is by "habitations or clubs"; these obey the instructions of the Grand Council, and annually send delegates to the Grand Habitation, which is held in London on or near the 15th of April, the anniversary of the death of Lord Beaconsfield. A noteworthy feature is the enrolment of women, or "dames," who take an active part in all the business of the association, having an executive committee and a fund of their own. The name and symbol of the league are derived from Beaconsfield's favorite flower.—*Solanum League and Covenant*. Bret. *leô, leu, ler*, a league. The Gallic *leig*, Ir. *leige*, are from E.] An itinerary unit not now in English use, except as a marine league. (See below.) The league as a unit of length originated in ancient Gaul, where it was equal to 1½ Roman miles, or 1.4 statute miles, improperly termed the Gallic mile. Afterward it was 2,000 paces, and in the middle ages it was in England 2 miles, or nearly 3 statute miles. It is a conventional, not a legal measure. A land-league is sometimes said to be 3 statute miles. The common league of France was 2,784 statute miles; the French post-league was 2,432 statute miles; the Spanish league was 4,214 statute miles; the Spanish judicial league was 2,334 statute miles; the Flanders league was 3.9 statute miles; the Brabant league was the marine league. The league is still in use in parts of the United States acquired from Mexico, where it is held to be about 2.63 English miles, and a square league 4,438.4 acres. The league is much used in South America. In the greater part of the Argentine Republic, as in Uruguay before 1864, it is equal to 6,000 varas, which, however, are of different lengths in different provinces; and the so-called Argentine league of 5,000 varas exists only in Santiago Del Estero. The postal league, however, varies from 4,000 to 5,000 varas; and in Tucuman the league is sometimes 4,980, sometimes 3,980 varas. The old league of Cuba was 4,900 varas. In Buenos Ayres the league is 5,200 meters, in Rioja 5,085.90 meters, in Colombia 5,000 meters, in Chili 4,812.882 meters, and in Paraguay 4,188 meters. A contract transferring a right to the possession and enjoyment of real property for life or for a definite period of time or at will, usually made in consideration of a periodical compensation called *rent*, in modern times usually payable in money, but sometimes in a share of the produce, and in former times frequently in services. The grantor or landlord is called the *lessor*, the grantee the *lessee*. The act of the grantor is called a *demise*; the right of the grantee is called the *term*; his holding under it is called a *tenancy*. The right of the lessor to have possession again at the end of the term, or sooner in case of forfeiture, is called the *reversion*. If the grantor has only a term and grants the whole of it, the contract is not technically a lease, but even if in the form of a lease, is deemed only an assignment. If the grantor of a term retains any reversion, even for a single day, the contract is a lease. A contract not transferring a right of possession, but merely contemplating that such right shall be transferred in the future, is not a lease, but an agreement for a lease. A contract transferring such a right to commence in enjoyment at a future date — as, for instance, one executed in February to give possession in May — is a lease; but the right of the lessee for the intervening period before the term is an *interems terminus*. The word *lease* is sometimes loosely applied to a letting of personal property.

2. The written instrument by which a leasehold estate is created. The word is also loosely applied to oral contracts of letting, which, however, are made void by the statute of frauds unless for a term not exceeding one year.

One air gave both their *lease* of breath.
Lowell, To Holmes on his Birthday.

3. The duration of tenure by lease; a term of leasing; hence, the terminable time or period of anything: as, to take property on a long *lease*; a short *lease* of life.

In this business she [the soul] sleeps out her *lease*, her term of life, in this death, in this grave, in this body.

= OFries. *leither*, *leider*, *līder*, *leer* = D. *leder*, *leer* = MLG. *leder*, LG. *ledder*, *ler* = OHG.

MHG. G. *leder* = Icel. *lethr* = Dan. *leder*, *lēr* = Sw. *lāder*, *leather*; not found native outside of Teut. The W. *lether*, Bret. *lezer*, *ler*, are of E. or LG. origin.] I. n. 1. The tanned, tawed, or otherwise dressed skin of an animal; dressed

hides or skins collectively. The peculiar character of leather is due to the chemical combination of tannin in the process of tanning, or of tannin and vegetable extractive matter (or else of some mineral or earthy base), with gelatin as contained in animal skin; its physical characteristics, such as flexibility, tensile strength, color, and durability, are more or less modified by the processes

subsequent to the chemical, and included in the various operations of currying and dressing. In commercial and popular usage *leather* does not include skins dressed with the hair or fur on; such skins are usually distinguished by compounding the word *skin* with the name of the animal from which they are taken: as, *seal-skin*, *beaver-skin*, *otter-skin*, etc. In the untanned state skins valued for their fur, or wool, and destined to be tawed and dressed for furriers' and analogous uses, are called *pelts* or *peltury*. In

England the term *pelts* is applied to all untanned skins. The term *skin* has also certain applications relating to leather which seem to follow no rule, but are sanctioned by general usage: thus, leathers made from the skins of kids, dogs, sheep, pigs, and calves, and in general from the skins of all small domestic and of many wild animals, are distinguished by the names of the animals: as, *dog-skin*, *sheep-skin*, *pig-skin*, *calveskin*, *buckskin*, or *deer-skin*. Buff-leather is an exception to this usage. (See *buff*, 2.) In general, leather made from skins of adult bovine domestic animals is called *cowhide*, and that made from skins of horses is called *horsehide*. The tanned skins of large animals, either wild or domestic, are distinguished by the word *hide* with the name of the animal from which the skin was taken prefixed, except when the skin has the fur or hair left upon it: as, *rhinoceros-hide*, *hippopotamus-hide*, *buffalo-hide* (tanned with hair removed); *leopard-skin*, *buffalo-skin* (tanned or tawed with hair or fur on). Leather made from the skins of alligators and aquatic animals is, however, generally called *skin* with the name of the animal prefixed: as, *alligator-skin*, *shark-skin*, etc. (See also *skagreen*.) The outer side of the skin both before and after tanning is called the *grain side*, or simply the *grain*; the opposite side is called the *flesh side*.

Two thicknesses are thus obtained, either of which may be used, which are better adapted for some uses than the full thickness. The inner layer, of very inferior quality, is used for trunk-covers and similar purposes, and is sometimes finished and used for cheap books and shoes. Occasionally, however, splitting is done only to secure an even thickness in the outer part, when the operation is more properly called *skiving*.—**Transparent leather**, raw hide treated with alum and glycerin, and thus rendered more or less translucent.—**Twisted leather**, oiled leather twisted from strips into a cord-like form for straps or bands, used with grooved pulleys and for other purposes.—**Vegetable leather**, a material composed of India-rubber spread upon linen according to a patent process, very tough, and capable of being made of any thickness by additional layers of linen covered and cemented with the India-rubber. It is made in long rolls. *Urs*, Dict.—**Whang-leather**, tough leather used for cutting into narrow strips, such as laces, cracker for whips, and small straps. Also called *lace-leather*.—**White leather**, tawed leather; so called because the natural color is not darkened by the process, as is the case with tanned leather.

Helmets were also often made of this material.—**Leather belting**, leather first shaved to an even thickness, and then cut into strips of definite width which are chamfered off and riveted and cemented together at the ends to form one long piece. It is closely related to the genus *Oryza* (to which rice belongs), but differs from it in having only two glumes instead of four, and often less than six stamens. The plants are marsh-grasses with narrow leaves which often have sharp, rounded edges that cut the flesh of those who pass through places where they grow. Five species are known, all of which occur in America, but one of them, *L. oryzoides*, is also found in Europe and temperate Asia, and another, *L. hazandra*, is widely distributed throughout the tropical regions of the Old World. Three species occur in the United States, and are known as *white-grass*, especially *L. virginica*. *L. oryzoides* is the rice-cut-grass, and *L. leucocarpa* the fly-catch grass. The name *Leeria* was given six years earlier to a genus of mosses, on which account it has been proposed to restore to the grass genus the name *Homalocenchrus*, proposed by Mies in 1768.

This psalm came to be associated especially with the 25th day of March, formerly the beginning of the year, and thus a general pay-day; hence the application of the phrase to "ready money," an application probably assisted by a humorous twist given to the literal translation 'lay down the law,' taken to mean 'lay down what is required,' i. e. Λεγιών, Λεγιών*, < *L. legio* (n.), a Roman legion, < *legere*, gather, select, = *Gr. λέγω*, collect; see *legend*.] 1. In *Rom. antiq.*, a body of infantry not corresponding exactly to either the regiment or the army-corps of modern times, composed of different numbers of men at different periods, from 3,000 under the kings to over 6,000 under Marius, usually combined with a considerable proportion of cavalry. The ancient legion had 900 horse, and that of Marius about 700. Each legion was divided into ten cohorts, each cohort into three maniples, and each manipulus into two centuries. The great power of the Roman legion was due to its rigid discipline and its tactical formation in battle, which was so open and flexible as to enable it to meet every emergency without surprise or derangement. It thus presented a strong contrast on the one hand to the unwieldy solidity of the Greek phalanx, and on the other to the confused and undisciplined state of other armies of the time. Compare *manipulus*.

Our legions are brim-full, our cause is ripe.

Shak., J. C., iv. 2. 215.

2. In *French hist.*, one of numerous military bodies so called at different periods. *Foreign legions* were employed by the kings from medieval times. In Haeckel's system, for example, the *legion* intervenes between the *subclass* and the *order*, and corresponds to what is usually called a *superorder*.—*Legion of Honor*, in France, an order of distinction and reward for civil and military services, instituted in May, 1802, during the consulate, by Napoleon Bonaparte, but since modified from time to time in important particulars. Under the first empire the distinctions conferred invested the person decorated with the rank of *legionary*, officer, commander, grand-officer, or grand-croix. The order holds considerable property, the proceeds of which are paid out in pensions, principally to wounded and disabled members.—*The Thundering Legion*, in Christian tradition, the name given to a legion of Christians in the army of Marcus Aurelius, in battle with the Quadi, whose prayers for rain were answered, according to the tradition, by a thunder-shower, which refreshed the thirsty Romans, while it destroyed numbers of the enemy by lightning.

long and of varied coloration. It is very prolific, and vast hordes periodically migrate down to the sea, destroying much vegetation in their path. So numerous are they at times, and so sudden is their appearance, that they were fabled to rain down from the clouds. Large numbers of rapacious quadrupeds and birds hang upon their line of march and materially diminish their numbers. These migrations are said to portend a hard winter. *M. schistocolor* is a plain slaty-gray species of Siberia. *M. obesus* is a bright rusty-brown species inhabiting arctic regions of both hemispheres and common in northwestern America. In math., related to the lemniscate of Bernoulli.—2. $$\int \frac{ds}{\sqrt{1-s^4}}$$

which is exhibited in the quincuncial projection of the sphere.

II. n. In math.: (a) The locus of the point at which the tangent to an equilateral hyperbola meets the perpendicular let fall upon it from the center: a curve invented by James Bernoulli. It may also be defined as the locus of the point the product of whose distances from two fixed points is a quarter of the square of the distance of those points from each other. It is a kind of Cassinian, and is also a lemniscate in sense (c), below. (b) Any crunodal curve of the fourth order having only one real branch,

Fig. 1. 8th class ($x^4 + \frac{1}{2}x^2y^2 - y^4 = 0$).
Fig. 2. 8th class ($x^4 + 10x^2y^2 - 5y^4 = 0$).
Fig. 3. 20th class ($x^4 + 8x^2y^2 + y^4 = 0$).
Fig. 4. 20th class (bifurcal) ($x^4 + 20x^2y^2 + 10y^4 - x^2 + y^2 = 0$).

and this finite and symmetrical with respect to two axes. (This definition is an attempt to interpret that of certain writers formerly in dispute, who say that the lemniscate has the shape of an 8, but who give as the typical form a curve which, having a tacnodal cusp at infinity, is not a bispherical quartic. Curves satisfying this definition are of the 10th, 8th, and 6th classes. See *figures* and *Cassinian*.) (c) The locus of the point at which the tangent to a fixed conic is cut by a perpendicular let fall upon it from the center.

Its equation is $(ax^2 + y^2) = ax^2 + by^2$. It is a unicursal bicircular quartic. (See *bicircular*.) It has two real and two imaginary tangents represented by the equation

$$\{ \frac{1}{2}ax^2 + (b-a)y^2 \} \{ \frac{1}{2}bx^2 + (a-b)y^2 \} = 0.$$

It is called an *ellipse* or *hyperbolic lemniscate*, according as the fixed conic is an ellipse or a hyperbola; in the former case the central node is an acnode, in the latter a crunode. See the figure. (n) A Cassinian: a misapplication of the word originating in Germany.

Any conform map-projection which shows every point of the globe twice (except the one thrown to infinity), and on a single sheet, transforms all circles into bicircular quartics, thus affording an easy way of studying the latter curves. If the point thrown to infinity is one of the poles, the parallels of latitude appear as Cassinians, while the meridians become equilateral hyperbolas.

lemniscus (lem-nis'kus), *n.*; *pl.* *lemnisci* (-i). [L., a pendent ribbon, < Gr. *λεμνίσκος*, a woolen fillet or band; with irreg. inserted *μ* and dim. term. *λεμνός*, < *λίπος* = L. *lipa*, wool.] 1. Cf. *limē*, from the same ult. source.] L. *n.* 1. The fruit of the rutaceous tree *Citrus medica*, var. *Limonum*. It is botanically a berry of an ellipsoid form, knobbed at the apex, with a pale-yellow rind whose outer layer is charged with a fragrant oil, and a light-colored pulp, full of an acid well-flavored juice. The latter, together with lime-juice, is the chief commercial source of citric acid. The oil or essence of lemons is extracted from the rind, at present by the method of expression, which yields the best. It is consumed in large quantities as a flavoring essence and a component of perfumes.

A fruit that the inhabitants call Maracoo, which is a pleasant wholesome fruit much like a *Lemon*. *Capt. John Smith, Works*, I. 133.

I'll be with you in the squeezing of a lemon.

Goldsmith, Rhe Rumps to Conquer, I. 1.

2. The tree that yields this fruit. It is found wild in the mountainous regions of India, especially in the north. As a cultivated fruit-tree, it was early known and disseminated by the Arabs, but appears not to have been established in Europe till comparatively late, perhaps brought by the crusaders. It is now cultivated widely in subtropical countries, and is grown industrially in Italy and the adjacent islands, in Spain and Portugal, and in Florida, generally in connection with the orange. The common lemon is a tree from 10 to 15 feet high. Unlike the orange, it is of irregular growth and of sparse foliage. The corolla of its flowers is purplish on the outside, and their fragrance is less heavy than that of orange-flowers. Its closest botanical affinity is with the citron, the two being now considered as varieties of the same species. See *Citrus*, 2.

The variety also includes the *suave* line. They lack the acidity of the common lemon. — **Water lemon**. See *water-lemon*.

There were also games and other public observances of the festival. Also called *larva*. Compare *Lari*, 1.

Lemuria (lē-mū'ri-ā), *n.* [NL., fem. sing., < *Lemur*, q. v.] In *zoögeog.*, a supposed former faunal area of the globe, corresponding to some extent to the geographical distribution of the lemurs, and characterized by the abundance and variety of those animals inhabiting it. The existence of any such region or continent is hypothetical, being inferred from, or held to account for, the present peculiar geographical distribution of the lemurs.

Professor Haeckel uses the latter noun [*Lemuria*], . . . as the name of a continent now largely submerged, which he supposes to have been the center of distribution of the lemurid ancestors of the higher orders of Mammalia, and part of which has perished, as Madagascar with its remarkable fauna. Paleontological discoveries have, however, shown that America can . . . lay as good a claim to have been the original home of the lemuroids.

Stand. Nat. Hist., V. 481.

Lemuria (lĕ-mū'ri-ā), *n. pl.* [NL., neut. pl., < *Lemur*, *q. v.*] In some editions of Cuvier's system, a subdivision of the *Chiroptera* (which comprised *Bimana* and *Quadrupana*) by which the lemurs, including *Chironys*, are distinguished collectively from monkeys and man. The teeth are of three kinds, and the incisors are not gliriform. There are pectoral as well as inguinal mammae. The fibula is distinct from the tibia, and the bony orbits of the eyes are open behind. The claws of the hind feet are like flattened nails, excepting that of the second toe. These animals are especially characteristic of Madagascar, but many also inhabit Africa, some India and islands further eastward. They are arboreal and quadrumanous, and many of them might be described as fox-like or cat-like monkeys; but their forms are very diverse. Their size ranges from that of a cat to that of a mouse. The family is divided into four subfamilies, *Indridina*, *Lemurina*, *Nycticebina*, and *Galapragina*.

Lemurinae (lĕ-mū'ri-nē), *n. pl.* [NL., < *Lemur* + *-inae*.] The typical subfamily of *Lemuridae*; lemurs strictly so called. The leading genera are *Lemur*, *Haplolemur*, *Leptlemur*, and *Chiroptaleus*.

Lemuroidea (lĕm-ū-roi-dē-ō), *n. pl.* [NL., < *Lemur* + *-oidea*.] 1. The lemuroidea, *prosimians*, or lemurs at large, a suborder of *Primates*, distinguished from *Anthropoidea*; the strepsirrhine quadrumanous mammals. The *Lemuroidea* are the lower series of *Primates*, having the cerebrum much less developed, leaving the cerebellum much uncovered; the teeth variable, not confined to the breast; the uterus bicornuate; and the clitoris perforated by the urethra. The ischial foramen of the skull is outside the orbit of the eye, and the orbit is open behind. The ears are pointed, with indistinct lobules or none. There are three families, *Lemuridae*, *Tarsidae*, and *Daubentonidae* (or *Chironyidae*).

lenge¹, *n.* A Middle English form of *long¹*.

lenger¹, *adv.* A Middle English comparative of *long¹*.

length (lĕngth), *n.* [*< ME. lengthe*, sometimes *lenthe*, < AS. *length* (= D. *lengle* = Icel. *lengd* = Dan. *længde* = Sw. *längd*), length; with formative -th (cf. *longu*, length), < *lang*, long; see *long¹*.] 1. The property of being long or extended in a single direction; also, that which is long.

That, like a wounded snake, drags its slow *length* along. *Pope*, Essay on Criticism, l. 157.

2. Distance along a line, as measured, for example, upon the circumference of a wheel that rolls over it; as, the *length* of a road, a river, or the arc of a curve.

though not so broad as our Cheapside in London. *Coryat*, Crudities, l. 30.

Every measuring instrument is liable to change its *length*
with temperature. It is therefore necessary, in defining
a *length* by reference to a concrete material standard, such
as a bar of metal, to state the temperature at which the
standard is correct. *J. D. Everett*, Units and Phys. Const., p. 17.

3. The magnitude of the greatest principal axis of a body or figure; one of the dimensions of a body, the others being *breadth* and *thickness*. See *dimension*, 1. Thus, the *length* of a stick of timber is not its longest measurement, between opposite angles, but is the shortest distance between the ends. Every body has three principal axes, which are capable of being determined with mathematical precision; and in most cases we can see what they are near enough for practical purposes. The distance between the extremities of the longest of these three axes is the *length* of the body.

Heaven forgive him too! *Shak.*, Macbeth, IV. 2. 284.

She . . . holds them dangling at arm's *length* in scorn. *Cowper*, Truth, l. 104.

5. Extent of or in time; duration; continuance; as, the *length* of a day or a year, or of life; the *length* of a battle or a performance; a discourse of tedious *length*.

cented or unaccented in modern or accentual poetry. See *long*, *a*.—7. A piece or portion of the extent of anything in space or time; a part of what is extended or elongated: as, a *length* of rope; a dress-*length*; to cut anything into short *lengths*: often used specifically of a definite portion, of known extent, of the thing spoken of, as of an acting drama (namely, forty or forty-two lines): as, an actor's part of six *lengths*; won by a *length* (that is, of the horse, boat, etc., engaged in the contest).

(b) After a time; at last; at the end, or at a point of transition: as, at *length* he came to a spring; at *length* they were subdued.—Basal-alar length. See *basal-alar*.—Basinal length. lens (lens), *n.*; pl. *lenses* (lén'zez). [= *Sp.* *lens*. *It.* *lente* (*It.* also, as *K.*, after *L.*, *lens* = *D.* *lens* = *G.* *lense* = *Dan.* *lindse* = *Sw.* *lins*). < *NL.* *lens*, a lens, so called from its shape, < *L.* *lens*, a lentil (which is shaped like a double-convex lens): see *lentil*.] 1. A piece of transparent substance bounded by two curved surfaces (usually spherical), or by a curved surface and a plane. The ordinary use of a lens is to cause pencils of rays to converge or diverge systematically after passing through it. Lenses for optical purposes are usually made of glass; acoustic lenses, of carbon dioxide enclosed between two thin membranes; lenses for action upon electrical radiations, of paraffin or pitch, substances which are transparent to electrical rays, though opaque to light. Optical lenses alone are in common use. Ordinary lenses are distinguished into two classes—*convex* or *magnifying lenses*, which are thickest in the center, and *concave*, which are thinnest in the center. Each class has three varieties, as shown in fig. 1.

To the first belong D, the *double-convex* or *biconvex*; C, the *plano-convex*; and E, the *meniscus*. The *convex lenses* are B, the *double-convex* or *biconvex*; A, the *plano-convex*; and F, the *convex-concave*, sometimes improperly called *convex meniscus*. The line which passes through the centers of curvature of the two surfaces is the *axis* of the lens, and a point on this axis so taken that every line drawn through it pierces parallel elements of the two surfaces is its *optical center*. A convex lens converges rays which are parallel to its axis, approximately to a point called its *principal focus* (F in fig. 2). The distance from the optical center to this focus is the same on both sides of the lens, and depends upon the radii of its curved surfaces and the material of which it is made. Rays diverging from a point beyond the principal focus F on either side of the lens are approximately collected to a "real" focus beyond the principal focus on the other side (see fig. 3); but if the source of light is between the lens and its principal focus, the rays after emergence diverge as if they came from a so-called *virtual focus* behind the luminous point. The luminous point and its focus are interchangeable, and are called *conjugate foci*, as, for instance, L and l in fig. 2.

(See *focus*, 1.) A concave lens always renders still more divergent rays emanating from a point, and so forms only virtual foci. If the source of light is an extended surface, then the pencil of rays emanating from each point forms its own focus; and the collection of foci constitutes an image, which is real and inverted if the foci are real, but virtual and erect if they are virtual. The relative sizes of the object and image are sensibly proportional, if the lens is thin, to their respective distances from the optical center; if the lens is thick, the distances must be reckoned from the two so-called principal points of the lens (see *principal point*, under *point*), which lie on the axis on each side of the optical center. An image formed by a single lens is never perfectly distinct, on account of the spherical and chromatic aberrations of the lens. (See *aberration*, 4.) The former is due to the fact that a lens bounded by spherical surfaces converges marginal rays to a point nearer the lens than that in which the central rays meet; the latter, to the fact that rays of different color form their foci at different distances, the focal distance for violet rays being (with a glass lens) nearly a seventh part shorter than that for the red rays. The spherical aberration can be corrected by making the surfaces of forms other than spherical, or by combining two or more lenses properly proportioned; the chromatic aberration, only by combining two or more convex and concave lenses of different materials, usually a convex of crown-glass with a concave of flint-glass.

2. In *anat.*, in the eye, a double-convex body placed in the axis of vision behind the iris between the aqueous humor and the vitreous humor, serving to focus rays of light upon the retina; the crystalline lens. See first out under *eye*.—3. Figuratively, photography, from the use of lenses in that art.

So thoroughly has this region been set forth by the pen and the pencil and the lens that I am relieved of the necessity of describing it. *Harper's Mag.*, LXXVIII. 258.

4. [*cap.*] [NL.] A genus of leguminous plants of the tribe *Viciae*. It is distinguished from *Vicia* by having but two valves instead of many, as is generally the case in *Vicia*. The 8 species enumerated by some are generally reduced to 2, which are low erect or half-climbing herbs with pinnate leaves and small single or racemose pale flowers, natives of the Mediterranean region and eastern Asia. One species, *Lens culcitra*, the seeds of which are called *lentils*, is probably one of the oldest of plants cultivated by man for food. See *lentil*.—*Achromatic lens*. See *achromatic*.—*Actinic lens*, a compound lens so constructed that its chemical and luminous foci coincide. — *Aplanatic lens*, a compound lens in which both chromatic and spherical aberrations are corrected. — *Apochromatic lens*, a microscope-objective made from certain peculiar kinds of glass, by means of which the aberrations can be more accurately corrected than in lenses made of the ordinary crown- and flint-glass. — *Burning-lens*, a convex lens used to concentrate the heat of the sun at its focus. — *Camera-lens*, a combination of lenses used in a camera obscura. See *camera*. — *Capule of the lens*. See *capule*. — *Cartesian lens*. See *Cartesian*. — *Coddington lens*, a lens formed from a sphere of glass by cutting a deep and wide equatorial groove around it, and filling the groove with some opaque substance. — *Collimating lens*. See *collimating*. — *Concave lens*, a lens that is thinner at the center than at the edge. — *Condensing-lens*, or *condenser*, a convex lens or a combination of lenses used to concentrate a strong light upon some point or surface, as upon the slit of a spectroscope or a microscope object, or a photographic negative in the process of making an enlarged picture. — *Convex lens*, a lens that is thicker at the center than at the edge. — *Copying-lens*, a photographic lens specially designed for copying engravings, etc. — *Crossed lens*, a glass lens the spherical surfaces of which have radii bearing the ratio of 1 to 6. It has less spherical aberration than any other form of glass lens with spherical surfaces. — *Crystalline lens*. See def. 2, *crystalline*, and *eye*, 1. — *Cylindrical lens*, a lens which has one or both surfaces cylindrical: commonly used in eye-glasses to correct astigmatism of the eye. See *astigmatism*. — *Diamond lens*, a lens made from a diamond. — *Doublet (lens)*, a combination of two lenses separated by a small distance. Sometimes each of the two is itself compound. — *Field lens*, in an eyepiece, the lens which is furthest from the eye, and has the special function of enlarging the field of view. — *Fluid lens*. See *fluid*. — *Fresnel lens*, a lens (bearing the name of its inventor) formed of a central plano-convex lens surrounded by segmental rings, all having the same focus. The separate pieces are cemented to a plane glass or set in a metal frame. (Fig. 4 represents the cross-section of such a lens.) It is used in lighthouses and signal-lamps. — *Immersion-lens*, a microscope-objective which requires a drop of water or other liquid to be put between it and the cover of the object under examination, thus increasing the angle of aperture and obviating loss of light by reflection. — *Landscape lens*, a photographic lens specially adapted to landscape photography. — *Magnifying-lens*, a lens used to increase the apparent size of an object seen through it. A convex lens held near the eye produces this effect when the distance of the object from the lens is less than the principal focal length of the lens. (O.F. in fig. 5.) The rays from the object *A*, after passing through the lens, reach the eye as if they came from the virtual image *a*. — *Multiplying-lens*, a plano-convex lens the convex side of which has been worked into a number of plane facets, each of which presents a separate image (virtual, and not magnified) of the object viewed through it. — *Orthoscopic lens*, a form of achromatic doublet

giving a very flat and undistorted field of view. — *Periscope lens*, a lens with a very wide field of view. The name is specially applied to spectacle-lenses which are concave on the surface next the eye; also to some wide-angle photographic lenses. — *Photographic lens*, a lens or combination of lenses adapted for photography. Ordinarily the lens of the photographic camera is a combination of two achromatic lenses of peculiar curves, mounted in a tube with a considerable space between them. (See fig. 6.) The photographic objective of a telescope is like an ordinary achromatic objective, except that its curves are adjusted to bring the blue and violet rays to the most accurate focus possible, rather than the yellow and green rays, which are most effective in vision. — *Polyzonal lens*. Same as *Fresnel lens*. — *Portrait-lens*, a photographic lens specially adapted to the taking of portraits. — *Rectilinear lens*, a photographic lens so constructed that straight lines in the object will not be distorted into curved lines in the picture. — *Slide-condensing lens*, a condensing-lens so attached to a microscope as to illuminate an opaque object by side-light. — *Stanhope lens*, a lens of small diameter with two convex faces of different radii, enclosed in a metallic tube. — *Triplet lens*, a combination of three lenses, usually all achromatic. The ordinary form of microscope-objective is a triplet. — *Wide-angle lens*, a photographic lens capable of making a distinct and undistorted picture of objects which subtend angles of 60° to 100° or more as seen from the camera; also, a microscope-objective which admits from each point of the object a pencil of rays of wide angle (often as much as 140° and upward); an objective of large angular aperture. See *aperture*, 4.

Lent¹ (lent), n. [*ME. lent, lente*, an abbr. of *lenten¹*, the final syllable being appar. taken as inflexive: see *lenten¹*.] An annual fast of forty days, beginning with Ash Wednesday and continuing till Easter, observed from very early times in the Christian church, in commemoration of Christ's forty days' fast (Mat. iv. 2), and as a season of special penitence and preparation for the Easter feast. The Lenten fast is now observed as obligatory by the Orthodox Greek and other Oriental churches, and by the Roman Catholic, Anglican, and Lutheran churches, and as a profitable exercise by many members of other churches. It has varied in length at different times and in different parts of the church, and has begun later or earlier according as Sundays only or Saturdays also were exempted from fasting. In the Western Church it begins on Ash Wednesday, forty-six days before Easter; but as the intervening Sundays, called *Sundays in* (not of) *Lent*, are on the ground that Sunday is always a feast-day (not counted part of Lent, the fast lasts only forty days. The first Sunday in Lent is known as *Quadragesima Sunday*, the fourth as *Mid-Lent Sunday*, the fifth as *Palm Sunday*, and the sixth (beginning Holy Week) as *Palm Sunday*. The two weeks and a half preceding Lent, beginning with Septuagesima, following which are Sexagesima and Quinquagesima Sundays, form the pre-Lenten season, a transition between the joyful Christmas and Epiphany season and the penitential season of Lent. In medieval times the name *Lent* (or, in Latin, *Quadragesima*) was given to other periods of fasting also. Forty days between Martinmas (November 11th) and Christmas Eve were called *St. Martin's Lent* (*Quadragesima S. Martini*), and another Lent preceded St. John Baptist's day (June 24th). In distinction from these, the period between Ash Wednesday and Easter was called *Great Lent* and *Clean Lent*, the last name being probably given on account of the preceding confession and absolution. In the Greek Church Lent (*Τεσσαρακοστή*) begins on the Monday after Tyrophagus (Quinquagesima), and the first, third, and sixth Sundays are called *Orthodoxy Sunday*, *Stavroproty-nismos* (Sunday of the Adoration of the Cross), and *Palm Sunday* respectively.

If it may be, fast
Whole Lent, and pray.
Tennyson, *St. Simeon Stylites*.

Great Lent, Great fast, in the Gr. Ch., the Lenten fast, as the most important fast of the year, in distinction from other seasons of fasting, to which the name *Lent* (as equivalent to *Τεσσαρακοστή*) is also given by Western writers; namely, that between St. Philip's day (November 14th) and Christmas (Fast of St. Philip or of the nativity), that after All Saints' Sunday, which corresponds to the Western Trinity Sunday (Fast of the Apostles), and that from August 1st to the 14th, the eve of the Beheading of Theodosius (Fast of the Theotokos). — *Head of Lent*. 'spring-fast', usually derived < *lang*, long (whence also *length* and *lengthen*), "because the days become longer in spring"; see *long¹*, a. This derivation is supported by the var. forms *OHG. langis*, *MHG. langes*, *langere* (appar. < *lang*, long); but the deriv. is irreg. in form and thought, and the *OHG. MHG.* var. forms may be due to popular etymology. It is not probable that the word is connected with *long*. In mod. use *lenten* as a noun is abbr. to *lent*, while in attrib. use it remains unchanged, being taken as an adj. in -en³.] 1. The spring; the season following winter.—2. In bot., a lens-shaped body of cells formed in the periderm or corky layer of bark, which by its enlargement soon ruptures the epidermis, or the older corky layers where such are present. Outwardly lenticels appear in the earliest stage merely as brighter spots, then as oval warts, becoming two-lipped; while in some plants they widen with the growth of the stem into transverse stripes. They are produced either beneath a stoma or group of stomata or independently. Their intercellular spaces are in communication with the outer air, and they thus serve the purpose of *cuticular pores*, which name they sometimes bear. The outer (not corky) cells of a lenticel are termed *passing* or *complementary cells*; the inner (corky) cells have been called *phelloderm*. Lenticels occur on the great majority of stems which produce bark in annular layers, also on the footstalks of many ferns.

A convex lens held near the eye produces this effect when the distance of the object from the lens is less than the principal focal length of the lens. (O.F. in fig. 5.) The rays from the object *A*, after passing through the lens, reach the eye as if they came from the virtual image *a*. — *Multiplying-lens*, a plano-convex lens the convex side of which has been worked into a number of plane facets, each of which presents a separate image (virtual, and not magnified) of the object viewed through it. — *Orthoscopic lens*, a form of achromatic doublet

A genus of South American trees, belonging to the order *Violariæ* and tribe *Aleodoideæ*. It is distinguished from *Alseodia*, the type of the tribe, by having the five petals partly connected, the connective of the stamens not produced, and an indehiscent fruit. There are two species, natives of Brazil and Peru. One, *L. glycyrrhiza*, produces a fruit that is eaten by the Peruvians, who call the tree the *achocni*. This genus was formerly placed in the order *Myrtaceæ* (*Myrtaceæ*), and later made by De Candolle to constitute an order (*Leoniceæ*) by itself.

2. In *pros.*, consisting of metrical Latin hexameters or elegiacs (alternate hexameters and pentameters), in which the final word rhimes

with the word immediately preceding the cesural pause or the middle of the line. The correspondence of sound between the terminations of the two halves of the pentameter is frequently imperfect, affecting unaccented syllables only, so as not to amount to a perfect rime. Leonine verses were extensively used in the middle ages, even as early as the eighth century. The following Latin version of "The devil was sick," etc., is a leonine elegiac couplet:

"Dæmon languēbat, monachus tunc esse volebat,
Aet ubi convalescit, mansit ut ante fuit."

Although classical poets avoided in general the use of rime, yet occasional instances of it can be found in their writings, and sometimes even examples of true leonine verses, such as this from Ovid:

"Quot cælum stellæ, tot habet tæa Roma puellæ."

The epithet *leonine* does not properly apply to other meters than those mentioned, nor to other distributions of rime.

It contains the Vatican, the Castle of St. Angelo, and the district between (known as the Borgo), and is inclosed within a separate line of walls. It was first fortified by Pope Leo IV. (847–855), whence the name. — *Leonine monkey*, the *Macacus leoninus* of Arazoa.

The pard or panther, *Felis pardus*, the largest spotted cat of the Old World. It ranks third in size, strength, and ferocity among the Old World *Felidae*, being exceeded only by the lion and tiger; but it is also inferior to the jaguar and cougar of America. The Himalayan ounce, *Felis irbis*, is about equal to it in size. A good-sized leopard is about 4 feet long without the tail, which is about 3 feet. The skull measures 9 inches in length by 5½ in breadth. The color is tawny, paler or whitish below, and nearly everywhere regularly and profusely spotted with black or blackish, the largest of these spots being ocellated or broken into rosettes. But the animal varies not

less in color than in size. Some individuals are black, though even in these cases of melanism the characteristic studded pattern of coloration may be traced. The leopard is smooth-haired, without mane or beard, agile as well as sturdy, and of somewhat arboreal habits, like the jaguar

Spenser, *F. Q.* IV. vii. 23.

Hor foot on one

Of those tame *leopard*. Kitten-like he roll'd
And paw'd about her sandal. Tennyson, *Princess*, iii.

2. In *her.*, originally, a lion passant gardant. Thus, the three lions on the shield of England as it existed in the reign of Henry III. are spoken of as leopards. In later heraldry an attempt has been made to discriminate between the lion and the leopard, but the only tonable distinction is when the leopard is represented spotted, which is common in modern heraldry. The practical identity of the two bearings is shown in this, that a leopard rampant is said to be a leopard *leopard*, and a lion passant gardant is said to be a lion *leopard*.

3. A gold coin, weighing from about 53 to 69 grains, struck by Edward III. and Edward the Black Prince of England, for circulation in

These crustaceans are free when larval, fixed to submerged objects when adult. Fixure is effected by the modification of the antennae into a flexible fleshy peduncle, sometimes very short, and sometimes a foot in length. This supports the hard calcareous shell or capitulum, normally of five valves, compressed to a flattened form, whose two sides are drawn together by a single transverse muscle. From the opening between the sides are protruded the long, slender, curved, and jointed legs resembling tentacles, which move at will with a sweeping motion. On each side of the body are several filamentous appendages, homologous with the gills of higher crustaceans and supposed to have a respiratory function. The alimentary canal is comparatively simple; there are three pairs of delicate mouth-parts; there is no heart or large blood-vessels. The *Lepadidæ* are mostly hermaphrodite, but in some species the animal of the normal form is strictly female, having one or more males of minute size and more simple organization lodged inside its shell. In others, which, though hermaphrodite, have the male organs less developed than the female, similar males are met with, and are termed *complemental males*.

Lepidodendron (lep'i-dē-den'dron), *n.* [*NL.*, < *Gr. lepis* (*lepid-*), a scale, + *δένδρον*, a tree.] A common fossil plant of the Carboniferous coal-measures, supposed, in some cases at least, to have furnished an important constituent of the coal itself. By most fossil botanists *Lepidodendron* is considered to be closely allied to the club-mosses (*Lycopodiaceae*), now widely spread plants. The fossil club-mosses are, however, not identical in structure or external appearance with any now living, one important difference being the much larger size of the fossil form. The surface of the stem of *Lepidodendron* is marked by peculiar, prominent, quincunally arranged, and generally lozenge-shaped "leaf-cushions" (also called "bolsters" and "leaf-bases"), which are sometimes distinctly separated from each other, and sometimes confluent above and below, and which vary greatly in size and shape with the age of the plant to which they belong. The leaf-scars are also usually rhombic (sometimes heart-shaped), and are situated on the upper or central part of the cushion, and marked with vascular impressions or scars, which are usually three in number, the middle one being always the largest. The young twigs were clothed with long narrow leaves. The internal structure of the plant varies considerably with the species, of which great numbers have been described, based chiefly on the differences in form and size of the leaf-cushions and -scars, which are now generally considered as furnishing very unreliable data for specific distinction. The fossil *Lepidodendron* are chiefly casts of the exterior. These plants are very characteristic of the middle and lower divisions of the productive (Carboniferous) coal-measures, and are widely distributed over the world. One species of *Lepidodendron* (*corrugatum*, Dawson) is very characteristic of the Lower Carboniferous in America. In Europe this genus is especially developed in the lower parts of the coal-measures. *Sternberg, 1820. See Sigillaria.*

These beautiful insects are known as butterflies and moths, the former being the *Lepidoptera diurna*, or *Rhopalocera*, and the latter the *Lepidoptera nocturna*, or *Heterocera*, respectively constituting the two suborders into which the order is now usually divided. In the adults the mouth is completely hamulose or antillar, the maxillae being modified into a tubular sucking-proboscis, and the mandibles being rudimentary. The modified maxillae have a pair of palpi. The head is loosely attached to the thorax, and the long member legs are very freely movable. The fore pair are rudimentary in some butterflies. The body is hairy; the prothorax has a pair of tippets or patagia, and the mesothorax a pair of scales, tegulae, or pa-

Lepidoptera. The pupa is obteated. The larva, known as a *caterpillar*, is mandibulate, having masticatory instead of suctorial mouth-parts, and is provided with from 4 to 10 prolegs or prop-legs besides the 6 true legs. The lip of the larva bears a double-ribbed spinneret, a tubular organ through which passes the silk of which the cocoon is fabricated. Caterpillars are almost invariably vegetable-feeders, and often prove highly destructive. A few species are known to be carnivorous. Upward of 50,000 species are described. In the Linnaean system, prior to 1758, the *Lepidoptera* consisted of the two genera *Papilio* and *Phalaena*, corresponding to the modern suborders *Rhopalocera* and *Heterocera*, or butterflies and moths; later, in the same system, of the genera *Papilio*, *Sphinx*, and *Phalaena*, corresponding to the Latreillian *Lepidoptera diurna*, *cynipularia*, and *nocturna*. Later writers divided the order into the families *Papilionidae*, *Sphingidae*, *Agrotidae*, *Euphyidae*, *Bombycidae*, *Noctuidae*, *Geometridae*, *Pyrastidae*, *Tortricidae*, and *Tineidae*; and nearly all of these have been further subdivided into other families.

and diffuse masses of leprous tissue, distributed especially to the skin and along the nerves, but occurring elsewhere. Leprosy begins slowly and haltingly with the ordinary signs of feeble health, and develops into one or the other of the two recognized types of the disease, or into a mixed form. In one type, *lepra cutanea* or *lepra tuberculosa*, the skin and mucous membranes are the principal places of deposit of leprous tissue, and there is formation of nodules, indolent ulcers, and cicatrices. The other form, *lepra nervorum* or *lepra anæsthetica*, in which the nerves are principally affected, is characterized by pains and anæsthesia in various nerve-regions (the motor paralysis being remarkably scanty), and by various dystrophies consequent upon the nervous lesions, bullous eruptions, spots of pigmentary surplus or deficit, glossy skin, muscular atrophy, and the loss of fingers and toes. Patients with *lepra nervorum* seem to live longer than those with *lepra cutanea*. Leprosy is unknown among brutes. It is communicated from man to man, but seems usually to require extreme intimacy of association. Leprosy has been prevalent in almost all countries of the world. At present it is frequent in many parts of Asia and Africa, and in some of the islands of the Pacific and Indian oceans. In Europe it occurs in Scandinavia, in Finland, in Iceland, and there is some in Spain. It prevails in many parts of South America, Central America, and Mexico, and in a number of the West Indian islands. In America north of Mexico there are some points of prevalence in the southern part of the United States, some among the Chinese of the western coast, and some among the Scandinavian immigrants of the northwest. There are also some infected localities in New Brunswick, in Cape Breton, and in Greenland. Leprosy is also called *lepra Arabum*, *elephantiasis* or *elephantiasis Græcorum*, and *leprosy*. Leprosy is also called *lepra nervosa*, *lepra miltidans*, *dry leprosy*, *joint-leprosy*, and *non-tuberculated leprosy*.

It also was less-majesty to take into a latrine a ring or a piece of money bearing the effigy of Caesar. Also spelled *less-majesty*.

=Syn. *Smaller*, *Less*, *Fewer*. *Smaller* is rather more exact than *less*, but is used freely of persons and of things both concrete and abstract: as, a *smaller* man, soul, size. *Less* is not used of persons: as, *less* trouble, happiness, size, degree; *less* of an evil. With reference to size and number, the proper words are *smaller* and *fewer*. "This apple is *less* than that." "There were *less* people there than I expected." are inelegant and erroneous, although similar expressions are often used both in speech and in writing. While the latter, however, is inexcusable, the former may be used sparingly without offense in certain colloquations, especially in poetry. The allusion to the mustard-seed in Mark iv. 31 appears to be the only example in the Bible of the use of *less* in the sense of 'smaller in size.' In Shakspere's plays the word occurs more than two hundred times, and in Milton's poems more than a hundred; in the former it is used only four or five times and in the latter three times in the sense of 'smaller in size,' and never in that of 'fewer.'
